1.3. Iné dôležité informácie k základným údajom o organizácii a zmeny za posledné obdobie (v zameraní, v personálnej štruktúre a pod.)

Ústav anorganickej chémie SAV v roku 2023 nezaznamenal žiadne zásadné zmeny v organizačnej štruktúre. Prepočítaný počet pracovníkov v roku 2023 je na úrovni 62,53 FTE (z toho 41,75 vedeckých pracovníkov), čo je vyšší stav v porovnaní s rokom 2022 (59,15 a 38,84). V roku 2023 bol priemerný vek všetkých pracovníkov ústavu 47,2 roka a priemerný vek vedeckých pracovníkov 45,9 roka, čo predstavuje mierny nárast v porovnaní s rokom 2022. Vzhľadom na to, že nedochádza k plynulej generačnej výmene, postupne sa zvyšuje aj priemerný vek zamestnancov. V roku 2023 sa na ústave zamestnali traja vedeckí pracovníci zo zahraničia, z toho jeden z nich spadá do kategórie do 35 rokov. Zamestnávanie mladých schopných post-doktorandov na ústave je naďalej jednou z hlavných priorít, avšak nevieme ju v požadovanej miere naplniť. V priebehu roka ukončili zamestnanecký pomer dvaja zamestnanci s nízkym úväzkom, keďže im skončila pracovná zmluva na ústave.

ÚACH SAV, v. v. i. sa plánuje zapojiť do výziev, ak budú vyhlásené.

2.3. Výber najvýznamnejších výsledkov vedeckej práce organizácie v roku 2023

2.3.1. Výsledky na báze základného výskumu

Fotoaktivita a antimikrobiálne vlastnosti nanokompozitu poly(kaprolaktónu).

Moderné aplikácie polymérov často vyžadujú úpravy ich povrchov. V tejto práci sa realizovala modifikácia povrchu poly(kaprolaktónu) (PCL) pomocou častíc vrstevnatého silikátu (saponitu) funkcionizovaných molekulami fotosenzibilizátora, floxínu B (PhB). Princípom modifikácie bola fúzia tenkej vrstvy silikátu s taveninou PCL (**Obr. 1**). Následkom fúzie došlo k interkalácii reťazcov PCL medzi vrstvy silikátu, čím sa dosiahlo pevné spojenie fázy vzniknutého nanokompozitu (hrúbky niekoľkých μm) s maticou polyméru. PhB si zachoval fotoaktivitu, čo potvrdili merania fluorescence, časovo-rozlišenej fluorescence a kvantových výťažkov. Hlavnými výsledkami boli fotoaktívne a antimikrobiálne vlastnosti povrchu materiálu. Kompozit s najvyššou koncentráciou PhB pri ožarovaní zeleným svetlom vykazoval zníženie rastu biofilmu mikroorganizmu *S. aureus* na 3 % oproti kontrole. Predpokladáme, že uvedená metóda môže nájsť široké uplatnenie v modifikácii povrchov polymérov.

Obr. 1. Schéma prípravy nanokompozitu na povrchu PCL fúziou vrstvy silikátu s taveninou polyméru (hore). Fotografie vrstiev silikátu na membránach (a,b) a ich kompozitov s PCL (c,d) získaných na svetle (a,c) a v tme pod UV lampou (b,d). Čísla v symboloch vzoriek vyjadrujú množstvo PhB ako pomer $n_{\text{PhB}} / m_{\text{silikát}}$ v mmol g^{-1} .

Bionanokompozitné materiály pripravené modifikáciou vrstevnatého silikátu polykatiónom

Po prvý krát sa interkaláciou podarilo pripraviť kompozity na báze vrstevnatého silikátu a dvoch, štruktúrne podobných, ale z nábojového hľadiska rozdielnych polymérov: kationovým poly(etylénimín) (PEI) a neiónovým poly(2-metyl-2-oxazolínom) (PMeOx). Výsledky, získané pomocou experimentálnych metód, ukázali rozdiely medzi vrstevnatým silikátom modifikovaným polykatiónom PEI a neiónovým polymérom PMeOx. Kým kationový PEI sa interkaloval do medzivrstvia len do limitovaného množstva, v prípade neiónového PMeOx sa pozoroval jeho postupný nárast so stúpajúcim množstvom polyméru použitého na prípravu vzoriek. *Ab initio* DFT výpočty ukázali, že obidva polyméry sú naviazané na povrch montmorillonitu slabými až stredne silnými vodíkovými väzbami a systémy vykazujú vysokú energetickú stabilitu. Biokompatibilné kopolyméry, ktoré budú pripravené kontrolovanou polymerizáciou obidvoch študovaných polymérov a budú interkalované do medzivrstvového priestoru vrstevnatého materiálu by mohli byť perspektívne ako nosiče liekov alebo ako nano-plnivá do biodegradovateľných polymérov.

Fluoridové systémy pre recykláciu lantanoidov

V súčasnej dobe sa problematika takmer úplnej závislosti Európskej únie na dodávkach materiálov kritických prvkov z mimoeurópskeho prostredia rieši aj v Európskom parlamente alebo Európskej komisii. Naším výskumom sa snažíme prispieť k rozvoju procesov, ktoré by viedli k efektívnej výrobe/recyklácii kritických prvkov, konkrétne vybraných ľahkých prvkov vzácnych zemín s dôrazom na neodým. Z analýzy elektrickej vodivosti roztavených fluoridových systémov vyplýva, že vhodnými médiami na recykláciu sú niektoré eutektické zmesi s obsahom fluoridu lítneho, pričom vodivosť s prídavkom NdF_3 klesá nasledovne: $\kappa[(\text{LiF}-\text{CaF}_2)_{\text{eut}}-\text{NdF}_3] \cong \kappa[(\text{LiF}-\text{NaF})_{\text{eut}}-\text{NdF}_3] > \kappa[(\text{LiF}-\text{MgF}_2)_{\text{eut}}-\text{NdF}_3]$, zatiaľ čo systém $(\text{NaF}-\text{CaF}_2)_{\text{eut}}-\text{NdF}_3$ vykazuje výrazne nižšiu elektrickú vodivosť, čo je nežiadúce pre elektrochemické aplikácie. Z analýzy objemových vlastností vyplýva, že v uvedenom poradí systémov tiež rastie nežiadúci efekt objemovej expanzie s prídavkom NdF_3 . Tento trend bol navyše pozorovaný aj pre systémy s prídavkom SmF_3 a GdF_3 .

Inovatívny prístup elektrochemickej povrchovej úpravy kovov a zliatin v hlboko eutektických rozpúšťadlách pri izbovej teplote

Elektrochemická úprava kovov a zliatin je jedným z efektívnych spôsobov modelovania povrchových vlastností kovových výrobkov. Tím výskumníkov z Oddelenia keramiky Ústavu anorganickej chémie SAV prišiel s inovatívnou metódou elektrochemickej úpravy kovov a zliatin, s funkčným a biomedicínskym využitím. Navrhovaný postup ponúka úpravu v hlboko eutektických rozpúšťadlách na báze vitamínu B4 pri izbovej teplote, je šetrný k životnému prostrediu, efektívne využíva zdroje a je výhodnou alternatívou k elektrochemickým metódam využívajúcim vodné elektrolyty. Okrem toho je možné navrhovanú technológiu použiť na vytvorenie vysoko účinných foto- a elektrokatalyzátorov na výrobu „zeleného“ vodíka elektrolýzou z vodných roztokov a ľahko skombinovať s inými metódami povrchovej úpravy.

Obr. 1. Morfológie povrchu 3D tlačenej substrátov z titárovej zliatiny po pieskovaní a elektroleštení v hlboko eutektickom rozpúšťadle.

Počas realizácie projektu APVV-20-0322 sa ukázalo, že navrhovaná metóda aplikovaná po pieskovaní vzoriek umožňuje získať zliatiny titánu s vysoko drsným povrchom pozostávajúcím z mikro- a nano-štruktúr podobných skutočnému kostnému tkanivu (Obr. 1), pričom došlo k zlepšeniu aj iných fyzikálno-chemických vlastností. Tento pokrok má potenciál prispieť k oblasti biomedicínskeho inžinierstva a získané výsledky sa stali podkladom pre medzinárodnú patentovú prihlášku a rad vedeckých článkov v prestížnych impaktovaných časopisoch.

Vývoj metódy a meranie dynamiky rozpúšťania komerčných alumín v priemyselnom kryolitovom elektrolyte

V rámci tohto projektu bola vyvinutá a úspešne otestovaná metóda merania dynamiky rozpúšťania rôznych druhov priemyselných alumín (primárnych aj sekundárnych) v priemyselnom kryolitovom elektrolyte. Metóda je založená na meraní square wave voltametrie (voltametria obdĺžnikovým reverzným signálom) oxidácie elektroaktívnych častíc na báze Al–O na rotačnej diskovej elektróde vyrobenej zo skleneného grafitu. Metóda používa výrazne vyššie návažky ako v bežných laboratórnych podmienkach (3,6 kg kryolitového elektrolytu a 12 ´ 120 g aluminy) a vysokoteplotné (960 °C) elektrochemické meranie dynamiky rozpúšťania je zároveň doplnené on-line video záznamom postupného rozpúšťania alumín na hladine roztaveného elektrolytu. V rámci tejto významnej a pre ústav ekonomicky veľmi úspešnej spolupráce (spoločnosti Hydro aj RIO TINTO sú globálni hráči vo výrobe hliníka) bola vyprodukovaná aj jedna vedecká publikácia a unikátna metóda merania bola prezentovaná na prestížnom TMS mítingu v USA (TMS 2023 Annual Meeting & Exhibition, March 19–23, 2023, San Diego, California, USA).

2.3.3. Výsledky na báze medzinárodnej spolupráce

Kombinované štúdium vlastností defektnej uhlíkovej katódy pre vysokovýkonné LiO batérie.

V rámci medzinárodnej spolupráce v projekte AtomDeC v 2. spoločnej výzve V4-Japan v JRC programe sme sa venovali charakterizácii materiálu pre uhlíkovú katódu na báze defektného grafénu vo vysokovýkonných LiO batériách teoretickými metódami. Defektami sa rozumejú 5 a 7 členné kruhy, ktoré substituovali časti (6 členné kruhy) pravidelnej štruktúry čistého grafénu. Vznikli tak domény, ktoré významne zlepšili vlastnosti katódového materiálu. K celkovej charakterizácii daného materiálu ako aj potvrdeniu prítomnosti 5 a 7 členných kruhov významne prispela aj analýza vypočítaných vibračných módo v Ramanovom spektre štruktúrnych modelov tohto materiálu, kde boli detegované charakteristické D, D' a G pásy (Obr. 1), ktorých prítomnosť potvrdila defektnú štruktúru experimentálne pripraveného materiálu na partnerskom praovisku v Tohoku university, Japonsko.

Oxofluórohlinitan cézny, $\text{Cs}_2\text{Al}_2\text{O}_3\text{F}_2$, ako nová fáza a jej existencia v kvarternárnom komplexnom systéme $\text{CsF}-\text{AlF}_3-\text{Al}_2\text{O}_3-\text{Cs}_2\text{O}$

Uskutočnila sa komplexná štruktúrna a fázová analýza systému $\text{CsF}-\text{Al}_2\text{O}_3$. Metódou termickej analýzy sa zadefinovali fázové polia vo fázovom diagrame a identifikovali sa tuhé fázy, existujúce v skúmanom systéme. Systém reprezentuje stabilnú diagonálu kvartérneho systému $\text{CsF}-\text{Al}_2\text{O}_3-\text{AlF}_3-\text{Cs}_2\text{O}$. Bola identifikovaná nová fáza, a to oxofluórohlinitan cézny, $\text{Cs}_2\text{Al}_2\text{O}_3\text{F}_2$, pričom sa stanovila aj jej štruktúra. Charakteristikou tejto kryštálovej štruktúry je prítomnosť vrstiev, zložených z jednotlivých (AlO_3F) tetredrov, zdieľajúcich navzájom spoločné rohy, v ktorých sú umiestnené atómy kyslíka, zatiaľ čo atómy fluóru oddeľujú jednotlivé vrstvy. Počet a množstvo neekvivaletných kryštalografických polôh jednotlivých atómov, prítomných v uvedenej štruktúre sa určil pomocou ^{19}F , ^{27}Al a ^{133}Cs MAS NMR spektier v tuhom stave. Okrem $\text{Cs}_2\text{Al}_2\text{O}_3\text{F}_2$ sa z binárneho podsystemu $\text{CsF}-\text{Al}_2\text{O}_3$ zráža iba $\alpha\text{-Cs}_3\text{AlF}_6$ ako sekundárna tuhá fáza. Toto správanie sa líši od predtým skúmaných systémov $\text{MF}-\text{Al}_2\text{O}_3$ ($\text{M}=\text{K}, \text{Rb}$), kde $\text{M}_2\text{Al}_{22}\text{O}_{34}$ ($\text{M}=\text{K}, \text{Rb}$) dominovala, ako sekundárna tuhá fáza.

Vysokopevné spoje SiC materiálov pripravené pri relatívne nízkej teplote (1400°C)

Keramické materiály na báze karbidu kremičitého (SiC) sú vďaka ich nízkej hustote, výborným mechanickým vlastnostiam aj pri vysokých teplotách, a odolnosti voči žiareniu považované za jedny z najdôležitejších konštrukčných keramických materiálov pre jadrový a vesmírny priemysel. Nakoľko je výroba veľkých rozmerov a komplexných tvarov z týchto materiálov veľmi náročná, táto práca sa venovala vývoju inovatívneho spôsobu ich spájania. Vysokopevné spoje SiC materiálov boli pripravené pri relatívne nízkej teplote (1400°C) použitím 100 nm povlaku Pr. Počas spájania došlo reakciou medzi vrstvou Pr a substrátom SiC k vytvoreniu prechodnej fázy Pr_3SiC_2 , ktorá ďalej reagovala so substrátom SiC za vzniku tekutej fázy a nano-precipitátov SiC . Prítomnosť tekutej fázy zvýšila difúziu atómov na rozhraní, a uľahčila zhutnenie nano-precipitátov SiC s maticou SiC . To viedlo k tvorbe čiastočne bezšvového spoja. Pevnosť spojov dosiahla úroveň pevnosti základného SiC materiálu ($227 \pm 12 \text{ MPa}$) s iniciátorom lomu mimo v základnom materiály, čo potvrdilo, že pevnosť rozhrania bola vyššia ako pevnosť základného materiálu.

2.11. Iné informácie k vedecko-výskumnej činnosti.

Vývoj počtu časopiseckých karentovaných publikácií registrovaných v databáze WOS ukazuje schéma nižšie. V závislosti na metodike, na ktorú kategóriu sa vzťahuje prepočítaný podiel publikácie, je možné uvažovať o kategóriách: vedeckí pracovníci, ostatní vedeckí pracovníci s VŠ vzdelaním, ostatní pracovníci zapojení do riešenia projektov a doktorandi. Vzhľadom na to, že nie je k dispozícii jednoznačné usmernenie, budeme vychádzať z usmernenia poslednej akreditácie, kedy sa počet publikačných výstupov vzťahoval na počet zamestnancov s univerzitným titulom zapojených do výskumných projektov v danom roku. Cieľom je dosiahnuť a udržiavať dve (prípadne viac) publikácie na počet zamestnancov s univerzitným titulom zapojených do výskumných projektov, čo odpovedá štandardu vyspelých vedeckých pracovísk s podobným zameraním. V roku 2023, sa publikovalo 72 publikácií v CCC časopisoch, t.j. 1,7 publikácie na vedeckého pracovníka. V obrázkoch a tabuľkách uvedených ďalej je možné sledovať trendy v posledných rokoch vo vývoji počtu karentovaných publikácií, ako aj trendy v počte karentovaných publikácií vzťahnutých na FTE vedeckých pracovníkov. Ďalším sledovanými parametrami sú ohlasy na práce s afiliáciou ústavu uvedených vo WOS databáze a ich prepočet na jedného vedeckého pracovníka.

Tabuľky tiež ukazujú vývoj priemerného impekt faktoru výstupov (podľa JCR). Podstatnou skutočnosťou je, že stabilne rastie počet publikácií v časopisoch s vyšším IF.

Významnou časťou vedeckej aktivity je účasť na výzvach v rôznych projektových schémach. Každoročne, jednotlivé vedecké tímy na ústave podávajú niekoľko APVV projektov, ako vo všeobecnej, tak aj v bilaterálnych výzvach. V schéme VEGA projektov je ústav riešiteľom stabilne vysokého počtu projektov (aj spoločných spolu s univerzitnými pracoviskami).

Tiež je potrebné vyzdvihnúť úspešnosť ústavu naprieč všetkými vnútornými výzvami SAV; získané štipendiá v rámci Schwarzovho fondu (v roku 2023 mal ústav dvoch držiteľov štipendia), doktorandských projektov, bilaterálne medzinárodné projekty (TUBITAK-1, MOST-1, V4-Japan-1) vrátane projektu SASPRO II (aktuálne dva projekty). V minulom roku, bol ukončený projekt ŠF CEMEA, na ktorom ústav participoval. V rámci projektu sa zakúpila nová infraštruktúra, ktorá je k dispozícii všetkým zamestnancom ústavu.

V rámci výziev EÚ sa okrem výziev Horizon Europe ústav zapojil aj do výzvy v rámci schém **Era-net**.

Názov: Metal-doped graphene for battery industry; Výzva: M-ERA.NET Call 2023; koordinátor: Norwegian University of Science and Technology; partneri: CealTech AS, ÚACH SAV, v.v.i. (M. Matejdes), Karlova Univerzita, Česká republika, São Paulo State University, Brazília; stav: nepodporený

V roku 2023 sa ústav aktívne zapájal do rôznych výziev v rámci **Plánu obnovy SR**. Bolo podaných:

3.4. Najvýznamnejšie prínosy MVTIS ústavu vyplývajúce z mobility a riešenia medzinárodných projektov a iné informácie k medzinárodnej vedeckej spolupráci

Ako je uvedené v Tabuľke 2c, v roku 2023 ústav sa zapojil do COST projektu **European Materials Acceleration Center for Energy** so začiatkom riešenia 10/2023. Koordinátor projektu za ústav, Peter Tatarko sa zúčastnil úvodného stretnutia v Belgicku. V budúcnosti je možnosť zapojenia sa aj ďalších vedeckých pracovníkov, ktorí sa venujú súvisiacim problematikám zahrnutým v projekte.

V rámci bežiacieho projektu ATOMDEC, ktorý koordinuje E. Scholtzová náš ústav navštívila M. Michalská z partnerskej inštitúcie VSB - University, Ostrava, Česká republika, ktorá odprezentovala svoje výsledky počas prednášky "Application of nanomaterials in Li-ion batteries, supercapacitors and photocatalysis" (18.09.2023). Na ústave absolvovali výskumné pobyty Dr. Dawid Kozień, Department of Ceramics and Refractories, AGH University of Science and Technology, Kraków, Poľsko a Emilija Nidžović, Vinča Institute of Nuclear Sciences, University of Belgrade, Belehrad, Srbsko, Európskej keramickej spoločnosti JECS Trust. Granty na výskumné pobyty získali aj naši pracovníci P. Petrisková a N. Hosseini a A. Najafzadehkhoe, čo im umožnilo absolvovať niekoľko mesačných pobyty na inštitúciách v zahraničí (Taliansko, Francúzsko) a rozvíjať vedecké tematiky. Na ústave sú momentálne riešené dva projekty SASPRO, v rámci projektov sa aplikanti snažia rozvíjať nové spolupráce, prípadne udržiavajú spolupráce s ich predchádzajúceho pôsobenia. Obidvaja absolvovali pobyty v Nemecku. Výsledky získané v čase pobytov, boli alebo budú zahrnuté v spoločných

publikáciách.

Marián MATEJDES

- Univerzita Bayreuth, Bayreuth, Nemecko, absolvoval v dňoch 04-12/04/2023 služobnú zahraničnú cestu za účelom pokračovania v spolupráci a vykonania experimentov pomocou konfokálneho mikroskopu PicoQuant MT200. Prístupom k danému zariadeniu sa získali experimentálne výsledky časovo rozlíšenej 2D/3D fluorescenčnej anizotropie, ktorá ponúka možnosť štúdia molekulárnej orientácie a mobility fluorofórov enkapsulovaných v medzivrství fluorohektoritu, ako aj procesov, ktoré ich ovplyvňujú. Dané merania sú obzvlášť dôležité pri interpretácii mobility/imobility fluorofórov, ktorá môže ovplyvniť účinnosť prenosu energie. Takéto merania anizotropie sú informatívnejšie, pretože merania v steady-state režime uvádzajú iba priemerné hodnoty času, bez priameho zohľadnenia dynamických procesov. Pracovná cesta sa uskutočnila v rámci projektu SASPRO2.

Eva SKOURA

- AGH University of Science and Technology, Faculty of Mechanical Engineering and Robotics, Krakow, Poľsko, 13-17.03.2023, pobyt sa uskutočnil v rámci PROM - International scholarship exchange of doctoral candidates and academic staff projektu Polish National Agency for Academic Exchange, Európskeho sociálneho fondu a štrukturálnych fondov EÚ. Práca sa zamerala na sledovanie mechanických vlastností fotoaktívnych materiálov na báze saponitu. Počas pobytu si doktorandka osvojila novú metodiku a spolu s kolegami z hosťovskej inštitúcie vypracovali postup v nastavení podmienok merania mechanických vlastností pre vzorky vo forme polymérnych diskov, na ktorých bol nanosený film organicky modifikovaného vrstevnatého silikátu. Metodika nie je rozpracovaná na ÚACH.

Eva SCHOLTZOVÁ

Diskusia získaných výsledkov a spoločná príprava prezentácie na konferencii CESEP v Budapešti. Maďarsko. Návrh ďalšieho postupu pri riešení úloh projektu.
- VŠB Ostrava, Česko, 21.06 - 23.06.2023, návšteva partnerského pracoviska v rámci medzinárodného projektu AtomDec za účelom diskusie získaných výsledkov a sumarizácie spoločnej publikácie.

5.9. Iné dôležité informácie k pedagogickej činnosti

Ústav anorganickej chémie SAV, v.v.i. sa začiatkom roka 2023 ako každoročne zapojil do pedagogického procesu vypísaním PhD. tém ako externej vzdelávacej inštitúcie dvoch univerzít - PriF UK a FCHPT STU. Celkovo bolo vypísaných 7 tém v 4 študijných programoch (anorganická chémia, fyzikálna chémia a teoretická a počítačová chémia v spolupráci s PriF UK a anorganická technológia a materiály v spolupráci s FCHPT STU) ktoré boli zverejnené prostredníctvom AIS na príslušných fakultách a webovej stránke SAV. ÚACH SAV, v.v.i. má za posledné roky vypracovaný a úspešne aplikovaný vlastný systém zverejňovania PhD. pozícií pre získanie kvalitných študentov, a okrem webovej stránky ústavu, ich publikovalo aj na ďalších dvoch medzinárodných portáloch. V stanovenom termíne si prihlášky podali piati uchádzači, ktorí sa zároveň zúčastnili aj prijímacích pohovorov. Štyria uchádzači splnili podmienky, ale do prvého ročníka boli nakoniec zapísaní dvaja študenti; po jednom v programe Fyzikálna chémia na PriF UK a v programe Anorganická technológia a materiály na FCHPT STU. Zmenený spôsob pridelovania termínov na slovenskom zastupiteľstve v Teheráne neumožnil dvom študentom začať štúdium v septembri 2023, ale vďaka intenzívnej snahe predsedníctva SAV sa očakáva nástup jednej študentky v letnom semestri.

Študenti doktorandského štúdia a mladí vedeckí pracovníci do 35 rokov sa zapojili do Súťaže mladých pracovníkov do 35 rokov na ÚACH SAV, v.v.i. Súťaž sa uskutočnila dňa 23.10.2023 za účasti 14 študentov doktorandského štúdia z ÚACH SAV, v.v.i. Bratislava a TnUAD Trenčín. Potvrďuje sa trend z minulých rokov, kedy je úroveň súťažných príspevkov vynikajúca, čo ocenili členovia komisie, ako i ostatní zamestnanci ÚACH SAV, v.v.i., ktorí sa zúčastnili prednášok. Na ocenených miestach sa umiestnili:

1. Alper Güneren
2. Sanam Bashir
3. Debora Mišenková

Doktorandi ÚACH sa uchádzajú aj o projekty v rámci výzvy DOKTOGRANT, v roku 2023 sa Inga Zhukova stala úspešnou uchádzačkou tohoto projektu pre rok 2024.

7.7. Iné dôležité informácie o vedecko-organizačných a popularizačných aktivitách

V roku 2023 ústav oslavoval 70 výročie od jeho založenia. Pri tejto príležitosti bol zorganizovaný slávnostný seminár “Workshop on the occasion of the 70th anniversary of the Institute of Inorganic Chemistry SAS: Design of advanced inorganic materials”. Vedecké príspevky boli publikované v knihe abstraktov (ISBN 978-80-973578-7-0). Na workshop boli pozvaní hostia z rôznych ústavov SAV ako aj z univerzít, s ktorými ústav udržuje dlhodobú spoluprácu, ako aj bývalí zamestnanci.

Názov: Deň otvorených dverí na ÚACH SAV, v.v.i.

Miesto konania: Dúbravská cesta 9, Bratislava

Dátum: 07.11.2023

Deň otvorených dverí, ktorý je organizovaný v rámci Týždňa vedy a techniky na Slovensku mladými vedeckými pracovníkmi je prezentáciou výsledkov výskumu na ÚACH SAV, v.v.i. Pozvaní boli študenti základných aj stredných škôl zo Slovenska. Súčasťou programu bola prehliadka vybraných laboratórií ústavu, v ktorých vedecí pracovníci prostredníctvom modelových experimentov návštevníkom priblížili svoju každodennú prácu a informovali o praktickom využití zariadení. Tým najviac zvedavým názorne ukázali ich využitie aj nad rámec demonštračných experimentov. Dňa otvorených dverí sa zúčastnilo približne 30 študentov mimobratislavských škôl (Pezinok). Podujatie zabezpečili: Silliková V., Boháč P., Hanzel O., Pavlík V., Hičák M., Slaný M., Mlynáriková J., Jurová A., Pribus M. Planetová V.

14. Realizácia Koncepcie dlhodobého rozvoja a Akčného plánu organizácie

Vedná politika ústavu reflektuje dlhodobé zámery a aktuálne trendy súvisiace so spoločenskou objednávkou na domácej a zahraničnej scéne. Je založená na inovatívnosti vedeckého smerovania, ambicióznosti vedeckých osobností, ako aj na autonómnosti vedúcich vedeckých tímov.

14.1. Odporúčania z posledného pravidelného (akreditačného) hodnotenia organizácií SAV

Uvádzame záverečné hodnotenie, ktoré sme dostali od hodnotiaceho panela.

"This Institute has rather focussed research interests, studying dependence of properties of materials upon their microstructure and composition. This obstacle seems to support the development of main study trends in distinct Departments. Besides this general idea, it can be stated that the list of research topics is impressive and has significant potential for development, especially if the researchers participate in international research networks and follow the contemporary trends in methodology advancement. Certainly, the latter aspect needs investments that can come through extensive process of grant application activity, and from large contracts with industry. Therefore, the relatively modest level of grant applications as well as the contract works in general remains the main bottleneck of the development efficacy.

The publication output of the Institute has improved in last years, but not very much in terms of publications quality. Situation with patenting is still not good, and this area provides opportunity of significant improvement.

Comments and recommendations for further improvement and development of the institute

The present structure of the Institute seems to be rather optimal, Departments have experienced staff, and are equipped with necessary apparatus. Therefore, there seems to be no immediate need to proceed with some structural reforms. It is more important to create strategy for development of solid research objectives, considering the international trends and achievements. For this process the help of the International Advisory Board members can be used. And moreover, it would be important to include the research staff of the institute. And finally, invite perhaps prominent persons from industry. This planning activity is not the privilege of the Institute leadership.

It would be useful to prepare and publish a full SWOT analysis, where all raised questions have some answer. Until now the publication of scientific papers has been considered as the main research output of the Institute. For evaluation of these publications a complicated classification system of publications has been created. Due to movement of the scientific publishing policy towards the Open Access publication model, it is timely to reorganize this evaluation system of publications and implement the elements of Plan S. Hopefully this will change the landscape of bibliometrics in coming decade.

At the same time, it is important to motivate scientists to submit patent applications, to valorise their research results. This can be done in cooperation with companies to cover accompanying expenses. Already understanding that this may be possible could lead to several important changes.

It is understandable that all these recommendations cannot be implemented by the Institute alone, without legal and financial support from the SAS.

Proposal of overall institute rating: B"

Poznámka: Treba však poznamenať, že hodnotiaci panel nemal k dispozícii nezávislý posudok.

14.2. Hlavné body Akčného plánu organizácie a stav ich plnenia

Základnými a dominantnými cieľmi, ktorým sú podriadené všetky aspekty chodu ústavu, sú odborný rast, medzinárodná integrácia a spoločenské uplatnenie/úžitok výsledkov výskumu. Napĺňanie uvedených cieľov si vyžaduje komplexný prienik aspektov, ako sú:

- aktívna účasť na domácich a zahraničných projektoch,
- aktívna publikačná činnosť v medzinárodných časopisoch a prezentácia výsledkov výskumu na medzinárodných vedeckých fórach,
- zachovanie vekovej a odbornej kontinuity,
- vytvorenie podmienok pre vzdelávanie a odborný rast nielen PhD študentov a mladých vedeckých pracovníkov, ale aj erudovaných vedeckých pracovníkov,

- aktívna účasť na vzdelávacom procese s dôrazom na druhý a tretí stupeň vysokoškolského vzdelania,
- technické zabezpečenie pre výskum,
- finančné zabezpečenie výskumu,
- personálna politika,
- zabezpečenie kontinuity v oblasti vedenia organizačných štruktúr ústavu, vytvorenie podmienok pre manažérsky rast pracovníkov,
- diseminácia a popularizácia objektov a výsledkov výskumu v odbornej a laickej spoločnosti,
- spolupráca a kooperácia s domácimi a zahraničnými akademickými, ako aj priemyselnými partnermi,
- zabezpečenie fungovania administratívnych požiadaviek.

Projektové tímy

Štruktúra ústavu v sebe inherentne zahŕňa flexibilné projektové tímy, ktoré sú vytvárané s ohľadom na objektové, resp. metodické možnosti a schopnosti jednotlivcov spájajúcich sa účelovo pri príprave a riešení projektov MŠ SR (štátne programy, projekty ŠF), VEGA, APVV, rámcových programov EÚ, NATO a v spolupráci s domácimi a zahraničnými partnermi z priemyslu. Táto flexibilná projektová štruktúra umožňuje pracovníkom resp. odborným skupinám podieľať sa na príprave vnútro-ústavných alebo aj mimo-ústavných vedeckých zoskupení, buď v rámci ústavu a SAV alebo aj mimo nich. Vedúci projektových tímov sú autonómni v rozhodovaní o spôsoboch riešenia projektu, ako aj v nakladaní s finančnými prostriedkami v súlade s projektovými cieľmi a zmluvami.

Personálna politika

V oblasti personálnej politiky sa ústavu dlhodobo darí udržať relatívne nízky priemerný vek zamestnancov pod 47 rokov. Podpora zamestnávania mladých vedeckých pracovníkov patrí medzi prioritné úlohy vedenia ústavu. Pre zvýšenie počtu a motivácie mladých absolventov doktorandského štúdia, aby neodchádzali z oblasti vedy do finančne lukratívnejších zamestnaní, boli prijaté nasledujúce zásady personálnej politiky:

- Získavanie najlepších študentov na doktorandské štúdium vo vedných odboroch, ktoré má ústav akreditované ako externá vzdelávacia inštitúcia.
- Získavanie zahraničných doktorandov prostredníctvom projektov Marie Curie Research Training Network alebo iných schém podpory zahraničných študentov (napr. DAAD), v ktorých je ústav zapojený.
- Vysielanie čerstvých absolventov doktorandského štúdia na dlhodobé (najmenej 3 mesiace) pobyty do zahraničia, aby sa zoznámili s najmodernejšou prístrojovou technikou, laboratórnymi postupmi a metódami práce vo vyspelých pracoviskách v Európe a vo svete (najčastejšie Japonsko a USA).
- Organizovanie medzinárodných podujatí doma, ako aj vysielanie mladých vedeckých pracovníkov a doktorandov na renomované konferencie v zahraničí s cieľom získať skúsenosti s prezentovaním vedeckých výsledkov.
- Pozývanie renomovaných odborníkov zo zahraničia na prednášky pre doktorandov a zamestnancov ústavu.
-

Technická infraštruktúra

Neoddeliteľnou súčasťou vednej politiky je aj rozvoj infraštruktúry. Ústav cielene buduje svoju infraštruktúru na rôznych úrovniach - cez laboratória na prípravu vzoriek až po laboratória na charakterizáciu pripravených materiálov. Vyžaduje si to dlhodobú aktivitu postupnej rekonštrukcie priestorov, ktorá je pre svoje špecifické požiadavky náročná ako finančne, tak aj časovo, pretože prebieha pri plnej prevádzke ostatných zariadení. Prístrojové vybavenie sleduje vzájomnú komplementaritu techník. Snahou je aj poskytovať voľné časové kapacity na merania pre partnerov na Slovensku, ako aj zapájanie ústavu prostredníctvom technickej infraštruktúry do medzinárodných zväzkov.

14.3. Aktualizácia Akčného plánu organizácie v roku 2023

Diskusie o akčnom pláne ústavu sú viacsmerným problémom. Je to dokument živý, ktorý si vyžaduje konkrétne zmeny v závislosti na okolnostiach (napr. zmeny v grantových agentúrach, legislatívne zmeny, prípadne zmeny a zámery zo strany P SAV). Na jednej strane je snaha naplňovať zadané ciele a ukazovatele zo strany manažmentu ústavu, na strane druhej sú impulzy zo strany vedeckých pracovníkov ako aj nevedeckých pracovníkov. V neposlednej rade je nutná aj interakcia smerom k P SAV.

16. Poskytovanie informácií v súlade so zákonom o slobodnom prístupe k informáciám

Uved'te informácie v súlade so zákonom č. 211/2000 Z.z. o slobodnom prístupe k informáciám.

17. Problémy organizácie a podnety pre Predsedníctvo SAV k činnosti SAV

Zásadný problém, ktorý narastá niekoľko rokov bez náznakov akéhokoľvek zlepšenia, sú administratívne nároky na pracovníkov na všetkých úrovniach. Pre potreby naplnenia legislatívnych povinností ústavu v napríklad v oblasti verejného obstarávania je jeden plný úväzok pre administratívneho pracovníka málo, ale mzdové prostriedky ústavu neumožňujú rozšírenie administratívy bez zásahu do výskumných kapacít. Výsledkom je, že niektoré administratívne výkony vykonávajú aj vedeckí pracovníci, nad rámec alebo na úkor svojich odborných aktivít. Pre mnohé z týchto aktivít by sme privítali centralizovanejší a systematickejší prístup. Situácia sa však skomplikovala prechodom na verejno-výskumné inštitúcie. Rýchle zmeny v legislatíve (často nekonceptné), nedostatok financií na samotnú vedu, komplikovaná aktuálna celospoločenská situácia a nedostatok informácií spôsobuje zásadné komplikácie pri plánovaní akýchkoľvek aspektov základného, ako aj rozvojového fungovania organizácie. Preto je viac ako žiadúce výrazne zintenzívniť komunikáciu medzi ústavmi a rovnako aj smerom k P SAV s cieľom výmeny informácií, skúseností s riešením problémov, ako aj s cieľom hľadania perspektív pre ďalší rozvoj.

Uved'te informácie a podnety v súlade s názvom kapitoly.

18. Vyjadrenia vedeckej rady organizácie k výsledkom výskumnej činnosti za uplynulý rok

Vedecká rada ÚACH SAV v.v.i. na svojom zasadnutí 23.1.2024 hodnotila vedeckú aktivitu vedeckých oddelení ako aj výskumnej organizácie ako celku. K výsledkom výskumnej činnosti v roku 2023 prijala nasledujúce zhodnotenie výsledkov výskumnej činnosti:

Priemer publikácií zaradených v databázach CCC je 1,74 publikácie na jedného vedeckého pracovníka. Hoci publikačný priemer je nižší ako minulý rok (2,0) je možné publikačnú aktivitu považovať za uspokojivú. Pozitívom je lepšia vyrovnanosť v počte publikačných výstupov jednotlivých oddelení. Vysoká kvalita vedeckých výstupov je potvrdená publikovaním v renomovaných vedeckých časopisoch. V roku 2023 bolo 92% publikácií s afiliáciou ústavu zaradených do kvartilov Q1 a Q2.

Ústav je zapojený do riešenia projektov v rôznych projektových schémach. Počet riešených domácich projektov schémy VEGA je 12 (10 ako hlavný riešiteľ) a počet riešených APVV projektov je 15, z toho je v šiestich projektoch ÚACH hlavným riešiteľom projektov. Počet APVV projektov kde ústav vystupuje ako nositeľ projektu v posledných rokoch klesá, avšak je možné pozorovať zvýšenú aktivitu vedeckých pracovníkov pri podávaní projektov. V roku 2023 bolo podaných 10 projektov v rámci APVV, z ktorých je ústav v 5-tich návrhoch projektov hlavným riešiteľom. Vedecké témy riešených domácich projektov hodnotí VR ako primerané, dostatočne pokrývajúce celé spektrum vedeckých aktivít ústavu.

V rámci programu SASPRO realizujú svoje výskumné aktivity na ústave dvaja štipendisti, čo potvrdzuje atraktivitu organizácie pre vedeckú činnosť.

Ústav sa zapojil do mnohých z výziev Plánu obnovy, napr. bolo podaných 12 návrhov projektov v schéme Štipendiá pre excelentných výskumníkov a výskumníčky R2-R4, jeden veľký projekt pre excelentných výskumníkov, dva projekty na Podporu výskumných projektov zameraných na dekarbonizáciu ekonomiky v TRL úrovniach 1-3, jeden projekt v schéme Podpora výskumných projektov zameraných na digitalizáciu ekonomiky v TRL úrovniach 1-3 a jeden projekt na vytvorenie Transformačného a Inovačného Konzorciá.

Rezervy v projektovej činnosti sú podľa VR v zapájaní sa, a hlavne v získavaní medzinárodných projektov programu EÚ. V roku 2023 bol ústav zapojený ako spoluriešiteľ do jedného projektu H 2020 a jedného COST projektu.

VR pozitívne hodnotí zapojenie ústavu do výchovy doktorandov. V roku 2023 bol celkový počet školených doktorandov 14, z ktorých traja v roku 2023 ukončili doktorandské štúdium úspešnou obhajobou. Dobrou praxou je zapájanie doktorandov do projektov riešených na ústave hneď po nástupe na doktorandské štúdium. Kvalita doktorandského štúdia a dosiahnuté vedecké výsledky sú na ročnej báze monitorované vedeckou radou.

Na základe vyššie uvedeného VR ÚACH SAV, v.v.i. konštatuje, že Ústav anorganickej chémie SAV v.v.i. je spôsobilý vykonávať výskumnú činnosť.

Uvádzajte tu stručné rámcové hodnotenie výsledkov výskumnej činnosti schválené vedeckou radou organizácie a jej vyjadrenie k spôsobilosti organizácie vykonávať výskumnú činnosť.

Dosiahnuté výsledky:

Cieľom projektu je vytvoriť novú systematickú a komplexnú schému výskumu, vývoja a inovácii pre zrýchlený vývoj bezpečných a udržateľných pokrokových materiálov a technológií pre energetiku, čím sa posilnia európske výskumné a inovačné kapacity. Projekt pri svojom štarte 03.10.2023 združoval 37 partnerov z 18 krajín a 2 priemyselných partnerov. Očakáva sa, že počet partnerov počas riešenia projektu sa bude zvyšovať. Cieľom je združiť odborníkov s najmodernejšími digitálnymi a materiálovými kompetenciami, a vytvoriť základy pre budúce centrum excelentnosti pre pokročilé funkčne materiály, ktoré pomôžu pri prechode k zjednotenej a silnejšie EÚ. To sa dosiahne organizovaním spoločných workshopov, konferencií, seminárov, ale aj letných/zimných škôl pre študentov v rámci EÚ.

V rámci meraní na CEMHTI CNRS v Orléans, vo Francúzsku sa uskutočnili ^{19}F , ^{27}Al a ^{133}Cs MAS NMR merania systému $\text{CsF-Al}_2\text{O}_3$. Namerali sa NMR spektrá novej fázy, a to oxofluórohlinitanu cézneho, $\text{Cs}_2\text{Al}_2\text{O}_3\text{F}_2$, pričom sa stanovila aj jeho štruktúra. Charakteristikou tejto kryštálovej štruktúry je prítomnosť vrstiev, zložených z jednotlivých (AlO_3F) tetredrov, zdieľajúcich navzájom spoločné rohy, v ktorých sú umiestnené atómy kyslíka, zatiaľ čo atómy fluóru oddeľujú jednotlivé vrstvy.

4.) Vývoj nových metód spájania vysoko-entropických keramických materiálov (*Development of new joining methods for high entropy ceramics*)

Zodpovedný riešiteľ: Peter Tatarko

Koordinátor: Ústav anorganickej chémie SAV, v. v. i.
Počet spoluriešiteľských inštitúcií: 1 - Česko: 1
Čerpané financie: -
Podpora medzinárodnej spolupráce z národných zdrojov: 40416 €

Dosiahnuté výsledky:

V súlade s plánom projektu boli pripravené vysokoentropické zliatiny so zložením (Hf-Zr-Ta-Nb-Ti) a (Mo-W-Ta-Nb-V), ktoré pri riešení projektu budú používané ako spojovacie materiály pre vysokoentropické karbidy a boridy obsahujúce rovnaké prechodné kovy (pripravené v minulej etape riešenia projektu). Okrem prípravy vstupných materiálov boli realizované aj prvotné experimenty spájania materiálov. Vysokoentropické karbidy (Hf-Zr-Ta-Nb-Ti)C a (Mo-W-Ta-Nb-V)C boli priamo spájané (bez prítomnosti medzivrstvy) pri teplotách 1600°C – 1900°C využitím spájania za asistencie elektrického prúdu. Bezšvové spoje sa podarilo dosiahnuť pri teplotách od 1800°C . Zároveň bola realizovaná štúdia zmáčavosti povrchu vysokoentropických keramických materiálov roztavenými kovovými zliatinami, na báze Ni a Ag-Cu. Na základe výsledkov zmáčavosti boli vybrané najvhodnejšie zloženia zliatin (Ni-Ta a Ag-Cu-Ti), ktoré budú v ďalšom kroku použité na spájanie týchto vysokoentropických keramických materiálov.

Vysokoporézne amorfné keramické anódy na báze Si-O-C pre sodíkové batérie boli pripravené zosieťovaním a následnou dvojitupňovou pyrolýzou (900°C/3 h, 1200°C/1 h) polymérneho prekursoru. S cieľom zvýšiť elektrickú a tepelnú vodivosť SiOC anódy boli vzorky pyrolyzované v atmosfére dusíka namiesto argónu. Syntetizované SiOC prášky boli mleté v planetovom mlyne za podmienok nízkoenergetického (LEM) a vysokoenergetického mletia (HEM) s cieľom zistiť vplyv morfológie práškov (tvar a veľkosť častíc) na elektrochemické vlastnosti SiOC anód. XPS a EDX analýzy práškov ukázali, že chemické zloženie práškov mletých za LEM a HEM podmienok je porovnateľné. SiOC anódy pripravené z vysokoenergeticky mletých práškov vykazovali lepšie elektrochemické vlastnosti (nižšiu rezistivitu prenosu náboja a rýchlejšiu difúziu Na⁺ iónov). Tým sa podarilo dosiahnuť vyššiu celkovú špecifickú kapacitu pre HEM SiOC anódy. Dosiahnuté výsledky ukázali, že nižšia veľkosť častíc a vyšší merný povrch SiOC práškov má kladný vplyv na špecifickú kapacitu anódy. Z toho dôvodu boli pripravené aj SiOC aerogély z roztoku polymérneho prekursoru a DVB spojiva v n-hexáne. Reakcie prebiehali v nerez tlakovej nádobe pri 180°C po dobu 24 hodín. Z aerogélov budú pripravené SiOC anódy a následne testované.

V prvom roku riešenia projektu sa metódou sól-gél pripravili mezoporézne bioaktívne sklá v systéme SiO₂-CaO a dopovali saterapeutickými iónmi B a Co. Začal sa tiež proces optimalizácie nanášania bioaktívnych povlakov na ZrO₂ substráty metódou dip coating. Začali sa tiež aktivity zamerané na opracovanie resp. modifikovanie povrchu implantátov pomocou atmosférickej plazmy. Skúmala sa aj možnosť aplikácie plazmového opracovania na už nanesené vrstvy bioaktívneho materiálu s možnosťou zlepšenia biologickej odozvy resp. následnú adhéziu ďalších vrstiev pri nanášaní multivrstiev. Jednou z možností ako zlepšiť účinnosť bioaktívnych povlakov je vytvorenie povlaku použitím rôznych komponentov resp. viacerých vrstiev. Za týmto účelom sa pomocou precipitačnej metódy pripravili nanočastice nHAP. Tieto sa dopovali Zn a Ce a skúmal sa ich účinok na morfológiu pripravených nanočastíc ako aj biologickú a antibakteriálnu odozvu.

Hlavnou vedeckou aktivitou riešenia projektu bola modifikácia povrchov funkčne gradientných (FG) keramických materiálov na báze Si₃N₄, ktoré boli pripravené kombináciou techník odlievania pások a spekania v minulých etapách projektu. Boli študované 3 spôsoby modifikácie povrchu: kyslíkovo-acetylénovým plameňom, plazmovým leptaním, a chemickým leptaním. Takto upravené povrchy boli analyzované pomocou RTG a SEM, a následne boli študované ich biologické vlastnosti. Najnižšiu životaschopnosť buniek preukázali materiály, ktorých povrch bol upravený chemickým leptaním, ako následok odleptania bioaktívnych zložiek z hraníc zrn Si₃N₄. Naopak najlepšiu životaschopnosť buniek, ako aj rast buniek vykázali materiály, ktorých povrch bol modifikovaný kyslíkovo-acetylénovým plameňom. To bolo prisúdené prítomnosťou bioaktívnych zložiek v povrchovej vrstve materiálov, ako aj samotným pórovitým charakterom vrstvy. Stanovenie najoptimálnejšieho spôsobu prípravy FG materiálov a ich následnej povrchovej modifikácie možno považovať za najdôležitejší výstup projektu. Získané skúsenosti s opracovaním vzoriek kyslíkovo-acetylénovým plameňom boli potom využité aj pre iné materiály, napr. pre ZrB₂-SiC a vysokoentropickú keramiku, čo ďalej rozšírilo všeobecný prínos projektu v oblasti vývoja nových keramických materiálov.

V súčasnej dobe sa problematika takmer úplnej závislosti Európskej únie na dodávkach materiálov kritických prvkov z mimoeurópskeho prostredia rieši aj v Európskom parlamente alebo Európskej komisii. V snahe prispieť k rozvoju procesov, ktoré by viedli k efektívnej výrobe/recyklácii kritických prvkov sme namerali ucelený súbor dát pre hustotu roztavených systémov. Z experimentálnych meraní hustôt a následnej analýzy objemových vlastností vyplýva, že v poradí systémov (LiF-CaF₂)eut-NdF₃, (LiF-NaF)eut-NdF₃, (LiF-MgF₂)eut-NdF₃ rastie nežiadúci efekt objemovej expanzie s prídavkom NdF₃. Tento trend bol pozorovaný aj pre systémy s prídavkom SmF₃ a GdF₃.

Skúmal sa vplyv LiOH ako dopantu na zhutňovanie práškov MgAl₂O₄ pomocou metódy SPS a na finálne vlastnosti a transparentnosť hutnej keramiky. Dva komerčné prášky horečnatého spinelu s rôznymi veľkosťami špecifického povrchu sa dopovali až do 0,6 hm.% LiOH a spekali sa pomocou SPS s nízkou (2,75 °C/min) a vysokou (100 °C/min) rýchlosťou ohrevu. Nižšia rýchlosť ohrevu bola optimálna pre nedopovaný horečnatý spinel (bez LiOH) s najvyššou reálnou in-line transmitanciou (RIT) 84,8% pri vlnovej dĺžke 633 nm. V druhej časti projektu sa pripravilo sklo so zložením 2CaO-Al₂O₃-SiO₂ (gehlenit) dopované 0, 0,25, 0,50 a 1,50 mol. % Bi³⁺. Pripravené vzorky boli RTG amorfné. Tepelné vlastnosti pripravených skiel sa skúmali pomocou DTA. DTA záznamy všetkých študovaných vzoriek obsahovali len jeden exotermický efekt priradený kryštalizácii gehlenitu. Teplota kryštalizácie klesala s narastajúcim obsahom Bi. Na základe hodnôt kinetických parametrov sa určilo, že rýchlosť nukleácie gelentiu v sklách je konštantná, a nezávisle od obsahu Bi je rast kryštálov trojrozmerný a riadený difúziou.

Optimalizovaná bola príprava mikrogulôčok v systéme Y₂O-Al₂O₃ dopovanom luminiscenčne aktívnymi iónmi Eu³⁺/2⁺. Detailne preštudované boli luminiscenčné vlastnosti v závislosti od koncentrácie aktivátora, podmienok prípravy skryštalizovaných mikrogulôčok (optimalizovaný časovo-teplotný režim v redukčnej atmosfére). Eu²⁺ -dopované systémy vykazujú pri excitácii NUV emisiu bieleho svetla, ktorú je možno ladiť vlnovou dĺžkou excitačného žiarenia s posunom do červenej spektrálnej oblasti. Pripravené systémy vykazovali nízke zhášanie luminiscencie s teplotou v teplotnom intervale 25-200°C. Žiarovým lisovaním a technikou SPS (Spark Plasma Sintering) boli pripravené kompozity dopované Eu²⁺/Eu³⁺ emitujúce biele a červené svetlo pri excitácii NUV iba s jedným typom aktivátora v matici. Detailne preštudované boli aj transparentné materiály na báze MgAl₂O₄ dopované luminiscenčnými aktivátormi Tb³⁺ a Cr³⁺, čo umožnilo ladenie farby emitovaného svetla (luminiscencie) v závislosti od excitačnej vlnovej dĺžky. Z pohľadu optickej termometrie sa sľubnými javia oxy-fluoridové sklá obsahujúce fluoridové nano-krytalické fázy NaYF₄ a LiYF₄ dopované Er³⁺/Yb³⁺ aktivátormi.

V rámci riešenia projektu bol pripravený granulovaný prášok karbidu kremičitého pomocou vymrazovacieho granulátora a prídavku granulačných aditív. Následne tento granulovaný SiC prášok bol tepelne žiňaný. Takto tepelne upravený prášok bol lisovaný uniaxiálne a spekaný pri teplote 1900°C vo vákuu pri tlaku 70 MPa s rôznou dobou výdrže od 5 min do 80 min. Týmto procesom sme dosiahli takmer úplne hutný (relatívna hustota bola vyššia ako 99 % teoretickej hustoty) materiál karbidu kremičitého s rôznym pomerom α-SiC β ?-SiC fázy. Na takto pripravených materiáloch bola pomocou SEM pozorovaná mikroštruktúra a lomové plochy. Taktiež XRD a Raman preukázali, že s rastúcou dobou spekania rástol podiel ?-SiC fázy v materiáli. Ďalej bol skúmaný vplyv ?-SiC a ?-SiC fázy na funkčné vlastnosti SiC (elektrickú a tepelnú vodivosť). Z výsledkov vyplýva, že s rastúcim obsahom ?-SiC (z 63 na 94 %) stúpa tepelná difuzivita z 47.3 na 68.4 mm²/s a zároveň elektrická vodivosť klesá zo 104 na 8 S/m. SiC materiál s najvyššou tepelnou difuzivitou mal po prepočítaní cez špecifickú tepelnú kapacitu a hustotu, tepelnú vodivosť okolo 190 W/m.K., čo je jedna z najvyšších tepelných vodivostí pre SiC materiál spekaný do teploty 1900°C.

Ťažiskom riešeného projektu v roku 2023 bolo komplexné skúmanie vzťahov medzi zložením, štruktúrou a fyzikálnymi vlastnosťami bio skiel obsahujúcich okrem SiO₂ aj sieťotvorný oxid P₂O₅. Termodynamický model Shakhmatkina a Vedishcheva 45S5 Bioglass® dopovaný rôznymi koncentraciami Li₂O sa stanovilo pri T = 800 K. Bolo identifikovaných 55 zložiek z ktorých na základe štatistických výpočtov sa získalo 10 významných zložiek s nezanedbateľným rovnovážnym množstvom. Pre každé študované sklo bola stanovená: teplota skleného prechodu, koeficient tepelná rozťažnosť skla a metastabilnej taveniny pomocou termodilatometrie. Nízko teplotná viskozita bola meraná termomechanickou analýzou. Aktivačná energia viskózneho toku bola vyhodnotená z teplotnej závislosti viskozity. Kompozičná závislosť nameraných vlastností bola analyzovaná pomocou korelačnej analýzy s Q-distribúciou silikátových a fosfátových jednotiek. Následne sa skúmala aktivačná energia viskózneho toku a teplota sklený prechod u ktorých bola pozorovaná silná negatívna korelácia medzi SiQ₀, SiQ₁, SiQ₂, a PQ₀. Zároveň bola identifikovaná silná pozitívna korelácia pre SiQ₃, SiQ₄, PQ₁, a PQ₂. Potvrdilo to aj zníženie miery zosvetenia, ktoré znižuje hodnoty E^{*} a T_g. Výsledky boli úspešne prezentované na konferencii (3rd Journal of Thermal Analysis and Calorimetry Conference and 9th V4 Thermoanalytical Conference) a následne opublikované v Journal of Thermal Analysis and Calorimetry (<https://doi.org/10.1007/s10973-023-12668-2>).

Povrchové analýzy (XPS a EDX) práškov ukázali, že chemické zloženie povrchu práškov mletých za LEM a HEM podmienok je porovnateľné. SiOC anódy pripravené z vysokoenergeticky mletých práškov vykazovali lepšie elektrochemické vlastnosti (nižšiu rezistivitu prenosu náboja a rýchlejšiu difúziu Na⁺ iónov). Tým sa podarilo dosiahnuť vyššiu celkovú špecifickú kapacitu pre HEM SiOC anódy. Dosiahnuté výsledky ukázali, že nižšia veľkosť častíc a vyšší merný povrch SiOC práškov má kladný vplyv na špecifickú kapacitu anódy. Z toho dôvodu boli pripravené aj SiOC aerogély z roztoku polymérneho prekursoru a DVB spojiva v n-hexáne. Reakcie prebiehali v tlakovej nádobe pri 180°C po dobu 24 hodín. Z aerogélov budú pripravené SiOC anódy a následne testované. Časť výskumu bola zameraná aj na prípravu keramických anód na báze Zr-O-C-(N) zo zmesi práškov ZrO₂ a uhlíkových sadzi žiňaním v atmosfére argónu a dusíka.

Dosiahnuté výsledky:

V projekte boli pripravené a podrobne charakterizované rôzne typy sklenených mikrosfér – plné, pórovité. Akermanitové sklá boli pripravené tavením zatiaľ čo sklá na báze hlinito-yttritého granátu sa pripravili sôl-gélovým procesom. Jedným z najdôležitejších výsledkov je, že sa z alkalicky aktivovaného farmaceutického skleneného odpadu podarilo pripraviť 3D tlačou filter bez potreby zhutnenia spekaním.

- Po alkalickej aktivácii poskytuje farmaceutické sklo stabilné gély, ktoré vytvárajú silné väzby medzi susednými časticami. Rovnomernosť a silná adhézia medzi jednotlivými komponentmi umožnili dosiahnuť vysoký pomer pevnosti k hustote (pevnosť v tlaku 1,5 MPa, pričom pórovitosť presahuje 70 %);
- Reakčná rýchlosť DIW spracovaných skeletov na dosiahnutie 100 % degradácie metylénovej modrej je 75 min, čo je priaznivé v porovnaní s inými uvádzanými kompozitmi na báze TiO₂, ktoré sa pohybujú od 90 do 240 min. Okrem toho sa vzorky môžu opakovane použiť počas piatich cyklov bez toho, aby došlo k výraznej strate účinnosti.

V predposlednom roku riešenia projektu sa pokračovalo v príprave modifikovaných vrstevnatých silikátov použitím rôznych kationových polymérov ako je N,N,N-trimetylchitosan, polydiallyldimetylamónium (PDDA) a polyoxazolinmi a polyetylénimínmi. Uskutočnila sa detailná charakterizácia pomocou spektroskopických metód. Sledovala sa schopnosť polykatiónom modifikovaných vzoriek adsorbovať vodu pri rôznych relatívnych vlhkostiach. Rozpracovala sa metodika prípravy polykatiónu z biopolyméru chitosan N,N,N-trimetylchitosan ako aj metodika prípravy tenkých filmov vo viaczložkovom systéme polykatión-vrstevnatý silikát-plastifikátor. Na pripravených vzorkách sa plánuje sledovanie ich antibakteriálnych vlastností.

Uskutočnila sa komplexná štruktúrna a fázová analýza systému CsF-Al₂O₃. Metódou termickej analýzy sa zadefinovali fázové polia vo fázovom diagrame a identifikovali sa tuhé fázy, existujúce v skúmanom systéme. Systém reprezentuje stabilnú diagonálu kvartérneho systému CsF-Al₂O₃-AlF₃-Cs₂O. Bola identifikovaná nová fáza, a to oxofluórohlinitan cézny, Cs₂Al₂O₃F₂, pričom sa stanovila aj jej štruktúra. Charakteristikou tejto kryštálovej štruktúry je prítomnosť vrstiev, zložených z jednotlivých (AlO₃F) tetrádrov, zdieľajúcich navzájom spoločné rohy, v ktorých sú umiestnené atómy kyslíka, zatiaľ čo atómy fluóru oddelujú jednotlivé vrstvy. Počet a množstvo neekvivaletných kryštalografických polôh jednotlivých atómov, prítomných v uvedenej štruktúre sa určil pomocou ¹⁹F, ²⁷Al a ¹³³Cs MAS NMR spektier v tuhom stave. Taktiež sa pomocou termickej analýzy sa stanovili fázové diagramy systémov Na₃AlF₆-NdF₃ a (Na₃AlF₆-NdF₃)eut-Nd₂O₃. Po termickej analýze bola vykonaná röntgenová difrakcia stuhnutých vzoriek oboch systémov. XRD analýza systému Na₃AlF₆-NdF₃ ukázala tvorbu dvoch nových zlúčenín; NaNdF₄ a NdOF. Tvorba NdOF je pravdepodobne produktom vysokoteplotnej hydrolýzy medzi vlhkosťou v atmosfére a NdF₃. XRD analýza stuhnutých vzoriek systému (Na₃AlF₆-NdF₃)eut-Nd₂O₃ ukázala tvorbu nasledujúcich nových zlúčenín; NaNdF₄, NdOF, NdAlO₃ a NaF.

Hlavnou úlohou bolo pripraviť funkčne gradientný (FG) biokeramický materiál na báze Si_3N_4 , ktorý pozostáva z minimálne 3 vrstiev s rôznym chemickým zložením: $\text{Si}_3\text{N}_4+\text{CaSiO}_3$, $\text{Si}_3\text{N}_4+\text{CaSiO}_3$ a $\text{Si}_3\text{N}_4+\text{CaSiO}_3+\text{Y}_2\text{O}_3$. Tieto vrstevnaté materiály boli pripravené homogenizáciou jednotlivých práškových zmesí, postupnou konsolidáciou jednotlivých vrstiev pomocou jednoosového lisovania za studena, a následným spekaním celej sústavy za asistencie elektrického prúdu. Za najdôležitejší výsledok možno považovať stanovenie optimálnych podmienok prípravy, ktoré vedú k tvorbe vysokohutného materiálu s výbornou príľnavosťou jednotlivých vrstiev. Následná etapa projektu sa zameria na štúdium mechanických vlastností týchto materiálov a ich porovnanie s vlastnosťami FG materiálu vytvoreného in-situ z homogénnej práškovej zmesi priamym vplyvom elektrického prúdu.

Bola realizovaná termická analýza roztaveného systému (LiF-NaF)_{eut}-LnF₃; Ln=Sm, Nd, Gd až do obsahu x(LnF₃ = 0.4). Vo všetkých troch prípadoch sa v dvojzložkových sústavách NaF-LnF₃ tvorí ternárna zlúčenina NaLnF₄ a jej kryštalizačné pole je prítomné vo všetkých troch diagramoch. Ternárna zlúčenina LiLnF₄ sa tvorí len v sústave LiF-GdF₃. Pre uvedené sústavy bola meraná aj hustota Archimedovou metódou a tieto experimentálne údaje poslúžili na objemovú charakterizáciu študovaných sústav. Hustoty i molárne objemy rastú s nárastom obsahu LnF₃ vo všetkých prípadoch. Hodnoty parciálnych molárnych objemov pre LnF₃ v tavenine (LiF-NaF)_{eut} pri nekonečnom zriedení sú pozitívne. Na základe pozitívnych hodnôt môžeme konštatovať, že pri tavení LnF₃ v tavenine (LiF-NaF)_{eut} dochádza k objemovej expanzii. Táto objemová expanzia klesá s narastajúcim protónovým číslom LnF₃ a vo všeobecnosti je vyššia pri nižších teplotách.

V prvej fáze projektu boli študované základné interakcie vybraných farbív s vrstevnatými kremičitanmi s cieľom pozorovať identifikovať javy ako molekulová agregácia, indukovaná emisia a fotosenzibilizácia singletového kyslíka.

Jedným zo skúmaných farbív bolo Reichardtovo farbivo adsorbované na piatich rôznych ílových mineráloch – saponite (Sumecton), baidellite, montmorillonite (Kunipia F) a dvoch hektoritoch (Laponit RD a hektorit SHCa). Zistilo sa, že adsorpciou tohto farbiva na častice ílových minerálov nedochádza k výraznejším zmenám v absorpčných spektrách, na druhej strane však môžeme pozorovať v týchto systémoch fluorescenciu, ktorá sa v prípade voľného farbiva v roztoku nepozorovala, čo je spôsobené javom adsorpciou indukovanej emisie.

Ďalším študovaným systémom boli systémy s farbivom 2-[(1E)-2-[(4-(difenylamino)fenyl)etenyl]-3-metyl-1,3-benzotiazol-3-ium] (Ozn. SIG373). Pilotné experimenty indikujú, že v roztokoch dochádza k degradácii farbiva a poklesu absorpcie s časom, zatiaľ čo v

hybridných sústavách so smektitmi dochádzalo k stabilizácii a signifikantnému zvýšeniu luminiscencie. Stabilizácia nestabilných molekúl na povrchu smektitov môže zohrávať významnú úlohu pri využití farbív. Na základe predbežného štúdia farbív s potenciálom kombinácie javov potlačenia agregácie a fotosenzibilizácie singletového kyslíka sme indentifikovali vplyv ťažkého aómu halogenidu na fotosenzibilizačné vlastnosti organických farbív. Pre potvrdenie predbežných pozorovaní bola vybraná séria molekúl fluoresceínu a jeho halogénových derivátov: 4,5,6,7-tetrachlórfluoresceín, 4,5,6,7-tetrachlór-2',4',5',7'-tetrafluórfluoresceín, 4,5,6,7-tetrachlór-2',4',5',7'-tetrachlórfluoresceín, floxín B a Rose Bengal.

Pre štúdium kombinácie javov adospricou indukovanej emisie (AIE) a senzibilizácie singletového kyslíka boli vybrané hybridné systémy na báze porfyrínových farbív. Študované boli farbivá Pt (III) meso-Tetra (N-Metyl-4-Pyridyl) porfyrín (PtTMPyP4+) a Pd (III) meso-Tetra (N-Metyl-4-Pyridyl) porfyrín (PdTMPyP4+). Ako nosič bol použitý syntetický smektit Sumecton. V pripravených vzorkách bol pozorovaný efekt adsorpciou indukovanej emisie, pričom jeho účinok bol vyšší vo vzorkách s nižším loadingom. Ďalej sme testovali schopnosť materiálov generovať singletový kyslík pomocou senzorovej molekuly ADMA, ktorá sa reakciou so singletovým kyslíkom rozkladá, čo je možné detekovať využitím UV-VIS spektroskopie. Všetky pripravené vzorky preukázali schopnosť produkovať singletový kyslík, pričom sme pozorovali rozklad ADMA v priebehu jednej až troch hodín. Účinnosť tvorby singletového kyslíka a rozkladu ADMA stúpala s množstvom použitého porfyrínového farbiva, pričom sme nezaznamenali signifikantné rozdiely medzi jednotlivými typmi porfyrínov.

Jedným z cieľov projektu je modifikácia povrchov polymérov pripravenými hybridnými systémami. Pre tento účel sme testovali vhodnosť využitia metódy “layer-by-layer” (LBL) s využitím spray-coatingu.

Metódou “layer-by-layer” (LBL) boli pripravené tenké filmy na báze smektitu (Sumecton – S), aniónového organického farbiva (Floxín B – PhB) a polykatiónového elektrolytu (Poly(dialyldimetylamónium) chlorid) – PDDA). Absorpčné spektrá, podobne ako v iných systémoch s PhB, vykazovali maximálnu absorbanciu pri 559 nm. So zvyšujúcim sa počtom vrstiev PhB/S/PDDA sa postupne zvyšovali aj hodnoty absorbancie, čo korelovalo so zvyšujúcim sa množstvom aniónov PhB vo filme. Emisné spektrá vykazovali maximálnu intenzitu pri 570 nm a podobne ako pri absorpčných spektrách sa hodnoty intenzity postupne zvyšovali spolu so zvyšujúcim sa počtom vrstiev PhB/S/PDDA.

Dosiahnuté výsledky:

Anódy pre lítiové batérie na báze uhlíka a kremíka (C/Si) boli pripravené vysokoenergetickým mletím v planetovom mlyne za optimalizovaných podmienok mletia. Boli študované dve zloženia aktívneho materiálu C/Si, konkrétne v hmotnostnom pomere 80:20 a 50:50. Napriek vyššej teoretickej kapacite C/Si anód v pomere 50:50 tieto vykazovali horšie elektrochemické vlastnosti. Dôvodom bola horšia adhézia anódy k medenej fólii (zberač prúdu).

Je všeobecne známe, že pri nabíjaní a vybíjaní batérií dochádza k veľkým objemovým zmenám častíc kremíku (300%), ich droleniu/lámaniu a následne k degradácii batérie. Z toho dôvodu boli testované rôzne druhy vo vode rozpustných spojív, ako komerčných (CMC/SBR) tak aj novovyvinutých (dopamín-alginát, sulfo-alginát), ktoré by dokázali obmedziť degradáciu častíc kremíku v dôsledku veľkých objemových zmien. Študoval sa aj vplyv obsahu spojiva v rozmedzí 4 – 15 hm%. Elektrochemické testy ukázali, že najvyššiu špecifickú kapacitu mali C/Si anódy s 10 hm% sulfo-alginátu.

Boli pripravené aj C/Si anódy, kde bol uhlík pridaný vo forme grafénu. Nepodarilo sa dosiahnuť výraznejšieho

zlepšenia elektrochemických vlastností anódy, pravdepodobne v dôsledku kolmej orientácie grafénových vrstvičiek k toku Na iónov.

Systematicky sme študovali aj vplyv vrstvičky ZnO pripravenej depozíciou atómovej vrstvy (ALD) na elektrochemické vlastnosti C/Si anódy. Hrúbku ZnO vrstvy sme kontrolovali počtom depozičných cyklov (10, 20, 40 cyklov). Elektrochemické testy ukázali, že najvyššiu kapacitu sa podarilo dosiahnuť pre anódu so ZnO vrstvou pripravenej 20 ALD cyklami (hrúbka vrstvy cca 5 nm). Na porovnanie boli pripravené aj anódy s prídavkom ZnO nanoprášku, ale špecifická kapacita bola nižšia v porovnaní s anódou pokrytou ALD ZnO vrstvičkou.

Pokrokové inžinierstvo biomedicínskych substrátov využívajúce DES, ktoré poskytuje možnosť syntetizovať mikro- a nanotextúry na 3D tlačených substrátoch Ti-6Al-4V, možno vyzdvihnúť ako jeden z najvýznamnejších dosiahnutých výsledkov. Nový prístup demonštroval schopnosť vytvoriť hierarchickú povrchovú štruktúru s mikro aj nanovzormi ako skutočné kostné tkanivo. Navyše bola preukázaná možnosť kombinácie novej elektrochemickej metódy s klasickým pieskovaním. Kombinácia pieskovania a elektrochemického spracovania v DES predstavuje životaschopnú stratégiu na úpravu povrchu, ktorá ponúka príležitosti na výrobu implantátov na báze titánu, ktoré vykazujú vynikajúce povrchové vlastnosti a podporujú lepšiu biologickú integráciu. Tento pokrok má potenciál prispieť k oblasti biomedicínskeho inžinierstva zlepšením výkonu a biokompatibility titánových implantátov. Získané výsledky sa stali podkladom pre medzinárodnú patentovú prihlášku s názvom „Metóda elektrochemickej povrchovej úpravy biomedicínskych produktov vyrobených z titánu alebo zliatin na báze Ti“, ktorá bola zaregistrovaná pod číslom PCT/SK2023/050006 (12.04.2023), autori : A. Riešenie projektu sa v tomto roku sústredilo na štúdium mechanických vlastností tzv. duálneho vysokoentropického materiálu, ktorý pozostáva z 60% vysokoentropického karbidu (Hf-Zr-Ta-Nb-Ti)C a 40% vysokoentropického boridu (Hf-Zr-Ta-Nb-Ti)B₂. Vysokočistý a plne hutný materiál bol pripravený v predchádzajúcej etape, a v tomto roku sa podarilo realizovať podrobnú mikroštruktúrnú analýzu, ako aj stanoviť vplyv fázového zloženia a hraníc zŕn na nanotvrdosť a tribologické vlastnosti. V rámci projektu sa tiež podarilo pripraviť hutný vysokoentropický karbid (Hf-Ta-Zr-Nb-Ti)C, pričom sa študoval vplyv množstva prídavku SiC whiskerov na jeho zhutnenie, mikroštruktúru a mechanické vlastnosti.

- Do programového balíka ReSpect sme implementovali referenčnú metódu na výpočet absorpčných spektier pre systémy s otvorenou obálkou. Táto metóda nie je vhodná na praktické kvantovo chemické výpočty, keďže sa dá použiť len na malé systémy, napriek tomu ide o dôležitý krok v projekte keďže nám poskytne referenčné dáta ktoré budú užitočné pri implementovaní hlavného cieľa projektu: metódy DR-TDDFT.
- Navyše sme implementovali nástroj na vizualizáciu tranzitnej hustoty, čiže aj na vizualizáciu spektier v röntgenovej oblasti čo je ďalším z hlavných cieľov projektu.

Dosiahnuté výsledky:

Počiatočná etapa projektu bola zameraná na získanie vstupných surovín keramických práškov, z ktorých sa následne pripravili dva druhy vysokoentropických karbidov na báze (Mo-Nb-Ta-V-W)C a (Zr-Hf-Ta-Nb-Ti)C. Materiály boli pripravené homogenizáciou karbidických práškov s následnou syntézou v tuhom stave pri teplotách 1400 – 2000°C. Podarilo sa pripraviť jednofázové zloženie, ktoré budú v ďalšom kroku charakterizované a študované. Rovnako sa v ďalšej etape navrhnu a pripravlia nové karbidické systémy s potenciálne zlepšenými vlastnosťami pri vysokých teplotách.

V rámci riešenia projektu sa testovala možnosť využitia slovenských bentonitov na prípravu geopolymérov. Geopolyméry sú anorganické polyméry vytvorené reakciou medzi alkalickým roztokom a aluminosilikátovou surovinou. Cieľom prvých experimentov bolo študovať vplyv teploty kalcinácie a koncentrácie alkalického aktivátora na proces geopolymerizácie gélov na báze metabentonitu. S postupným zvyšovaním koncentrácie alkalického aktivátora (5, 10 a 20% NaOH) a teploty kalcinácie (700, 750, 800 °C) sa zlepšovala geopolymerizácia. Uvedený trend sa prejavil aj na zvyšovaní merného povrchu, čo je veľmi sľubné pre adsorpčné procesy. Získané výsledky boli prezentované na zahraničnej konferencii a publikované v karentovanom časopise.

V roku 2023 sa dokončila príprava a charakterizácia kompozitných materiálov na báze montmorillonitu a troch polymérov - poly(2-metyl-2-oxazolín), poly(2-etyl-2-oxazolín) a poly(2-propyl-2-oxazolín). Študoval sa vplyv množstva polyméru a dĺžky bočného reťazca na adsorpčné vlastnosti a štruktúrne parameter pripravených materiálov. Zo získaných výsledkov sa pripravila publikácia [1], ktorá bola odoslaná do časopisu Macromolecules. Pokračovalo aj riešenie úloh zameraných na fotoaktívne vlastnosti hybridných materiálov organických farbív s vrstevnatými kremičitanmi. Farbivá pseudoizokyanín a derivát benzotiazolu boli študované pomocou experimentálnych spektroskopických metód a teoretických počítačových metód. Súbežne s experimentálnymi prácami pokračovali aj kvantovo-chemické simulačné výpočty väzbových interakcií a interkalačnej energie študovaných hybridných systémov polymér-ílový minerál a pollutant. Zistilo sa, že modifikácia smektitov výrazne podporuje stabilitu adsorbovaných polutantov. Ďalej boli pripravené ďalšie modely na báze iných smektitov (beidellit, saponit, Hectorit) s PMeOx za účelom štúdia vplyvu typu smektitu na mechanické vlastnosti polyméru. Výsledky sú spracované do článku [2] a budú čoskoro zaslané do Journal of Molecular Structure.

V ďalšej fáze projektu sa ukončilo štúdium kompozitných materiálov, pripravených predchádzajúcej etape, t.j. povlaky z organicky-modifikovaných vrstevnatých silikátov a antibakteriálneho farbiva Floxín, ktoré boli nanosené na povrchoch technických polyméroch. Otestovala sa ich antibakteriálna aktivita a uskutočnili sa doplnujúce analýzy ich mechanických vlastností, ktoré môžu vhodne doplniť informácie získané z testovania antibakteriálnych vlastností, ako aj z testovania ich fotoaktivity. V ďalších experimentoch sa pripravila séria vzoriek, v ktorej sa použil na modifikáciu vrstevnatých silikátov polykatión chitosanu, konkrétne N,N,N-trimetylchitosan. Pripravený polykatión sa použil na prípravu tenkých filmov s nanočasticami vrstevnatého silikátu, pričom sa menili parametre: typ plastifikátora na dosiahnutie kompatibility jednotlivých zložiek pre tenké filmy, rôzne množstvá smektitu. Zámerom bolo pripraviť tenké a stabilné transparentné filmy, ktoré by boli vhodné na použitie pre testovanie antibakteriálnych vlastností, a ktoré budú vykazovať lepšie antibakteriálne vlastnosti v porovnaní so samotným chitosanom. Nanočastice silikátu sa modifikovali pomocou iného bežne dostupného typu polykatiónu polydiallyldimetylammóniového (PDDA), ako aktívna zložka sa použili nanočastice striebra, ktoré vzorkám dodali antibakteriálne vlastnosti. Porovnaním dvoch rôznych typov vrstevnatých silikátov sa pozorovala rozdielna antibakteriálna efektívnosť podľa typu silikátu.

V roku 2023 sa podarilo optimalizovať prípravu práškových prekursorov, taktiež sa pokračovalo v optimalizácii veľkosti častíc systémov použitých na žiarové lisovanie. Vďaka týmto krokom sa podarilo pripraviť materiály so zaujímavými mechanickými vlastnosťami ($H_v=18$ GPa, $KIC=4.7$ MPa $m^{1/2}$). Riešili sa kinetika kryštalizácie vybraných skiel a overovala sa možnosť použitia JMAK modelu pri výbere a návrhu vhodných zložení a pri predikcii teplotného správania sa systémov. Pokračovalo sa v príprave a charakterizácii nových navrhnutých zložení v systémoch: Al_2O_3 - Y_2O_3 - Yb_2O_3 - Er_2O_3 a Al_2O_3 - Yb_2O_3 - Er_2O_3 , pričom boli pripravené systémy emitujúce čisté červené a čisté zelené svetlo, ktoré by mohli byť použité pri príprave fosforov pre vysokoteplotné aplikácie (1000°C).

Riešenie projektu nadviazalo na výsledky riešenia v predchádzajúcom roku, kde na základe teoretických výpočtov boli zvolené 3 systémy vysokoentropických boridov s rôznym pomerom jednotlivých prechodných kovov (Hf, Zr, Ta, Nb, Ti): $(Ta_{0.6}Hf_{0.1}Zr_{0.1}Nb_{0.1}Ti_{0.1})B_2$, $(Ta_{0.6}Hf_{0.25}Zr_{0.05}Nb_{0.05}Ti_{0.05})B_2$, a $(Ta_{0.6}Hf_{0.2}Zr_{0.1}Nb_{0.05}Ti_{0.05})B_2$. V tomto roku boli tieto materiály pripravené boro/karbidickou redukciou oxidových prekursorov a následným spekaním za asistencie elektrického prúdu. Proces prípravy bol optimalizovaný za účelom získania jednofázového tuhého roztoku s relatívnou hustotou nad 98%. Podrobnou fázovou analýzou sa podarilo preukázať, že mriežkové parametre pripravených materiálov sú v dobrej zhode s teoreticky vypočítanými údajmi. Štúdium tvrdosti týchto materiálov jasne preukázalo, že neekvimolárne diboridové materiály vykázali vyššiu tvrdosť ako referenčné ekvimolárne zloženie $(Ta_{0.2}Hf_{0.2}Zr_{0.2}Nb_{0.2}Ti_{0.2})B_2$. V ďalšom kroku sa budú študovať ďalšie vlastnosti týchto materiálov a zároveň sa uskutočnia ďalšie teoretické výpočty s cieľom navrhnúť nové diboridové štruktúry.

vodná fáza projektu bola zameraná na optimalizáciu prípravy polykatiónu chitosanu s tromi metylovými reťazcami. Po nastavení vhodných reakčných podmienok bol pripravený N,N,N-trimetyl chitosan sostupňom kvaternizácie 50%. Pripravený polykatión bol spolu so smektitom Sumectonom a plastifikátorom glycerolom použitý pri príprave tenkých transparentných filmov, ktoré boli rozpustné vo vode. V úlohe plastifikátora sa použil taktiež tributyl citrát, pričom sa podarilo pripraviť filmy so zníženou rozpustnosťou vo vode. Takto pripravené filmy boli z jednej strany zatavené polyetylénom, čím sa ich rozpustnosť vo vode znížila päťnásobne. Tenké filmy na báze trimetyl chitosanu a smektitu boli pripravené taktiež metódou „layer-by-layer“. Na aktivované skličko boli striedavo nanášané vrstvy polykatiónu a smektitu a takýmto spôsobom sa podarilo pripraviť tenký film, ktorý bol vo vode nerozpustný.

Viaczložkové fluoridy ($M_xR_yF_z$) s alkalickými kovmi a kovmi vzácnych zemín sú veľmi zaujímavé kvôli svojim optickým vlastnostiam, ktoré sú definované hlavne usporiadaním kationov (tvorených R a M) a ich okolia v kryštálových štruktúrach. Počas prvého roku realizácie projektu bola pozornosť venovaná zvláštnostiam syntézy (nizkoteplotné a vysokoteplotné metódy) a charakterizácii získaných vzoriek.

Syntéza z tavenín bola aplikovaná pri skúmaní interakcie komponentov v systémoch $(LiF-CaF_2)_{eut-n}LnF_3$ ($Ln = Nd, Sm, Gd$; $n = 0,01-0,4$ (pre Nd, Sm) / $0,3$ (Gd)). Spontánne ochladenie roztavených zmesí $(LiF-CaF_2)_{eut-n}\{NdF_3, SmF_3, GdF_3\}$ môže viesť ku kryštalizácii počiatočných zložiek, ternárnych fluoridov, ako aj tuhých roztokov. Po reakcii medzi $(LiF-CaF_2)_{eut}$ a LnF_3 sa teda predpokladá, že je možné pozorovať nasledujúce fázy: počiatočné zložky, t.j. LiF, CaF_2 a LnF_3 , usporiadané ternárne fázy, napr. $LiGdF_4$, nestechiometrické ternárne fázy, napr. $Ca_{1-x}Ln_xF_{2+x}$ alebo $Ln_{1-y}Ca_yF_{3-y}$. Čistý CaF_2 je pozorovaný len pri nízkych koncentráciách LnF_3 , čo potvrdzuje predpoklad, že neidentifikované fázy obsahujú Ca a majú zloženie $CaxLnyFz$. Posun odrazov indikuje tvorbu tuhých roztokov (alebo rozsah homogenity) v rámci rozsahu koncentrácie. Na Rietveldovu analýzu vzoriek $(LiF-CaF_2)_{eut-n}\{NdF_3, SmF_3, GdF_3\}$ bol zvolený model kryštálovej štruktúry CeH_3 pre kubické fázy $Ca_{1-x}Ln_xF_{2+x}$. Počiatočné hodnoty pre x boli vypočítané podľa stanovených parametrov buniek. Bunkové parametre kubických fáz $Ca_{1-x}Ln_xF_{2+x}$ sa menia s obsahom LnF_3 a pri porovnaní troch rôznych systémov súhlasia s účinkom kontrakcie lantanoidov.

Syntéza z roztokov bola použitá pre zlúčeniny $Na_2K(Zr,Hf)F_7$. Nové zmiešané kationové fluoridy Na_2KHfF_7 a $Na_2K(Zr,Hf)F_7$ spolu s izoštruktúrnym Na_2KZrF_7 boli syntetizované reakciami vo vodných roztokoch a štruktúrne charakterizované pri laboratórnej teplote s použitím prášku a monokryštálovej Röntgenovej difrakcie. Transformácie tuhých fáz pri zvýšených teplotách boli odhalené počas experimentov diferenciálnej skenovacej kalorimetrie a ďalej potvrdené röntgenovou práškovou difrakciou závislou od teploty. Zistilo sa, že zmiešané kationové fázy Na_2KZrF_7 , Na_2KHfF_7 a $Na_2K(Zr,Hf)F_7$ podliehajú ireverzibilným fázovým transformáciám, ktoré možno vysvetliť ich rozkladom nad $400^\circ C$. Kompletný súbor DSC údajov pre Na_2KZrF_7 , Na_2KHfF_7 a $Na_2K(Zr,Hf)F_7$ ukazuje, že tieto zlúčeniny podliehajú ireverzibilným transformáciám, ktoré sú spojené fázovým rozkladom nad $400^\circ C$ na zlúčeniny s jedným druhom kationu. Je potrebné poznamenať, že zlúčeniny Na_2KMF_7 ($M = Zr, Hf$ alebo Zr/Hf) a K_3MF_7 ($M = Zr, Hf$) majú v rámci série podobné tepelné vlastnosti. Napriek tomu je rozdiel medzi Na_2KMF_7 a K_3ZrF_7 významný. Možno konštatovať, že náhrada Zr/Hf má malý vplyv na vlastnosti, zatiaľ čo substitučný efekt Na/K je oveľa silnejší. Preto by stabilita týchto zlúčenín by preto mala výrazne závisieť od polomerov iónov Na alebo K a menej od polomerov Zr alebo Hf. Táto vlastnosť umožňuje syntetizovať fázy s presnou symetriou a požadovanými tepelnými vlastnosťami.

Hlavným cieľom prebiehajúceho projektu je pripraviť umelý fotosyntetický systém dispergovateľný vo vode, ktorý by bol schopný zachytávať slnečné žiarenie na ploche o veľkosti rádovo niekoľko tisíc μm^2 na časticu. Takto zachytená slnečná energia by mohla byť následne využitá na rôzne aplikácie vrátane fotodegradácie, fotodezinfekcie alebo fotokatalytických procesov. V projekte je navrhnutý prenos energie prostredníctvom umelej antény a mechanizmov nežiarivého alebo žiarivého prenosu energie. Získaná energia bude následne nasmerovaná ku kvantovým bodom umiestnených na periférii antény. Predpokladá sa, že excitačná energia prijatá kvantovými bodmi aktivuje procesy prebiehajúce na rozhraní medzi kvantovými bodmi a vodou. Hlavným cieľom v rámci prvého roku tohto projektu bolo vytvoriť robustný experimentálny postup na prípravu antény pozostávajúcej z enkapsulovaných fotoaktívnych molekúl medzi dvomi vrstvami vrstevnatého silikátu. Okrem použitia komerčne dostupných fotoaktívnych molekúl sa použili aj syntetizované štruktúry obsahujúce dlhý alkylový reťazec, prostredníctvom ktorého sa dá kontrolovať hydrofobicita a taktiež aj rovnováha fotoaktívnych molekúl nachádzajúcich sa v medzivrství alebo v binárnom rozpúšťadle. Interkaláciu fotoaktívnych molekúl do medzivrstvového priestoru vrstevnatého silikátu možno dosiahnuť prostredníctvom iónovej výmeny. Pri tomto postupe sú pôvodné sodné katióny nachádzajúce sa v medzivrstvovom priestore vrstevnatého silikátu nahradené fotoaktívnymi molekulami, pričom je tento proces primárne riadený coulombickými interakciami medzi kladne nabitými molekulami a záporne nabitými vrstvami silikátu. Iónová výmena musí byť uskutočnená tak, aby sa pripravila usporiadaná heteroštruktúra so striedajúcimi sa medzivrstvami sodíka a fotoaktívnych molekúl, čo znamená že k výmene musí dôjsť iba v každej druhej medzivrstve. Po rozdispergovaní usporiadanej heteroštruktúry vo vodnom prostredí dochádza k solvácii sodných katiónov. V závislosti od vrstvového náboja, objemová zmena medzivrstvového priestoru obsahujúca solvatované sodné katióny prekonáva coulombickú interakciu medzi vrstvami a sodíkom, čím dochádza k delaminácii monovrstiev fotoaktívnych molekúl enkapsulovaných medzi dvomi vrstvami vrstevnatého silikátu. Dodržaním optimalizovaných experimentálnych podmienok, akými sú zloženie binárneho rozpúšťadla, teplota a koncentrácia fotoaktívnych molekúl sa podarilo pripraviť usporiadané heteroštruktúry použitím syntetických vrstevnatých silikátov s vrstvovým nábojom 0.5 a 0.7 e-/huc. K úspešnej delaminácii usporiadanej heteroštruktúry došlo len v prípade vrstevnatého silikátu s menším vrstvovým nábojom, zatiaľčo podmienky potrebné k delaminácii usporiadanej heteroštruktúry s vyšším vrstvovým nábojom sa stále skúmajú. Pri použití oboch vrstevnatých silikátov bolo pozorované zvýšenie kvantového výťažku fotoaktívnych molekúl, ktoré bolo výraznejšie pre vyšší vrstvový náboj. Vyšší kvantový výťažok má pozitívny dopad na efektivitu prenosu energie na kvantové body. Efektivita však závisí aj od orientácie fotoaktívnych molekúl v medzivrstvovom priestore, a preto je dôležité vedieť ako je orientovaný prechodový dipólový moment. Túto otázku je možné zodpovedať použitím statickej fluorescenčnej spektroskopie v kombinácii s Levenberg-Marquardtovým iteračným postupom umožňujúcim fitovať experimentálne údaje požadovanou funkciou a následne extrahovať relevantné údaje.

Výskum sa zameriaval na pochopenie mechanických vlastností ílových minerálov zo skupiny smektitov a ich kompozitov s polymérmi. Skúmali sa interakcie polymérnej matrice poly(2-metyl-2-oxazolín) (PMeOx) v medzivrstvovom priestore montmorillonitu (Mt) experimentálnymi aj výpočtovými metódami (DFT metóda). Okrem toho sme štúdium rozšírili aj na ďalšie typy ílových minerálov zo skupiny smektitov, a to beidellit (Bd), saponit (Sap) a hektorit (Ht). Cieľom bola analýza typov interakcií v medzivrství skúmaných smektitov, štúdium vplyvu interkalácie polyméru na (d001) a výpočet elastických konštánt a elastických modulov pre čisté ílové minerály a kompozity. Na základe získaných výsledkov sa zistilo, že hektorit (Ht) vykazuje vynikajúce mechanické vlastnosti v rámci skúmanej skupiny smektitov a jeho potenciál pre prípravu kompozitov s polymérom PMeOX.

Jedným z cieľov projektu bolo pripraviť vysokoentropické zliatiny na báze (Mo-Nb-Ta-V-W) a (Zr-Hf-Ta-Nb-Ti), a študovať ich interakciu s povrchmi vysokoentropických karbidov obsahujúcich rovnaké prechodné kovy, t.j. (Mo-Nb-Ta-V-W)C a (Zr-Hf-Ta-Nb-Ti)C. Tieto zliatiny boli pripravené cestou práškovej metalurgie s následným spekaním za asistencie elektrického poľa, ale aj niekoľkonásobným oblúkovým tavením jednotlivých kovov. Zliatiny pripravené oblúkovým tavením vykázali vyššiu homogenitu a čistotu. Ďalším cieľom projektu bolo štúdium zmáčavosti roztavených zliatin na báze Ni na povrchoch vysokoentropických karbidov. Pri použití čistého Ni došlo k výraznému poškodeniu/rozpusteniu základného vysokoentropického materiálu, čo vylučuje možnosť využiť čistý Ni ako spojivo. Na zamedzenie tohto poškodenia/rozpustnosti, bola vytvorená eutektická zliatina Ni-Ta, ktorej uhol zmáčania bol < 15°. Zároveň nedošlo k rozpusteniu základného materiálu, a tak táto zliatina bola zvolená ako spojivo pre vysokoentropické karbidy.

V rámci projektu sa dobudovala výskumná infraštruktúra pracoviska, zakúpili a nainštalovali sa XPS analyzátor a poloprevádzková linka a povrchové úpravy skla sa rozšírila o 2 PVD moduly (plochú a rotujúcu katódu).

V rámci vedeckých aktivít projektu sa vyvinula metóda prípravy nanočastíc Y₂O₃ dopovaných CeO₂ precipitačnou metódou a optimalizoval sa postup prípravy kusovej Y₂O₃ keramiky s použitím týchto práškov. V rámci inej výskumnej aktivity projektu sa vyvinul nový druh sklenej membrány pre odstraňovanie toxických kovových polutantov z odpadových vôd. Membrány sa pripravili alkalickou aktiváciou odpadového skla, na povrchu ktorého sa v dôsledku aktivácie vytvorili štruktúry schopné adsorbovať ťažké kovy. Skúmal sa tiež vplyv obsahu Al₂O₃ na kryštalizáciu NaYF₄ v oxyfluoridových sklách a vplyv na mikroštruktúru výslednej sklokeramiky.

Správa z auditu účtovnej závierky

Názor

*Uskutočnili sme audit účtovnej závierky spoločnosti **Ústav anorganickej chémie SAV**, v. v. i. („Spoločnosť“), ktorá obsahuje súvahu k 31. decembru 2023, výkaz ziskov a strát za rok končiaci sa k uvedenému dátumu, a poznámky, ktoré obsahujú súhrn významných účtovných zásad a účtovných metód.*

Podľa nášho názoru, priložená účtovná závierka poskytuje pravdivý a verný obraz finančnej situácie Spoločnosti k 31. decembru 2023 a výsledku jej hospodárenia za rok končiaci sa k uvedenému dátumu podľa zákona č. 431/2002 Z. z. o účtovníctve v znení neskorších predpisov (ďalej len „zákon o účtovníctve“).

Základ pre názor

Audit sme vykonali podľa medzinárodných auditorských štandardov (International Standards on Auditing, ISA). Naša zodpovednosť podľa týchto štandardov je uvedená v odseku Zodpovednosť audítora za audit účtovnej závierky. Od Spoločnosti sme nezávislí podľa ustanovení zákona č. 423/2015 o štatutárnom audite a o zmene a doplnení zákona č. 431/2002 Z. z. o účtovníctve v znení neskorších predpisov (ďalej len „zákon o štatutárnom audite“) týkajúcich sa etiky, vrátane Etického kódexu audítora, relevantných pre náš audit účtovnej závierky a splnili sme aj ostatné požiadavky týchto ustanovení týkajúcich sa etiky. Sme presvedčení, že auditorské dôkazy, ktoré sme získali, poskytujú dostatočný a vhodný základ pre náš názor.

Zodpovednosť štatutárneho orgánu za účtovnú závierku

Štatutárny orgán je zodpovedný za zostavenie tejto účtovnej závierky tak, aby poskytovala pravdivý a verný obraz podľa zákona o účtovníctve a za tie interné kontroly, ktoré považuje za potrebné na zostavenie účtovnej závierky, ktorá neobsahuje významné nesprávnosti, či už v dôsledku podvodu alebo chyby.

Pri zostavovaní účtovnej závierky je štatutárny orgán zodpovedný za zhodnotenie schopnosti Spoločnosti nepretržite pokračovať vo svojej činnosti, za opísanie skutočností týkajúcich sa nepretržitého pokračovania v činnosti, ak je to potrebné, a za použitie predpokladu nepretržitého pokračovania v činnosti v účtovníctve, ibaže by mal v úmysle Spoločnosť zlikvidovať alebo ukončiť jej činnosť, alebo by nemal inú realistickú možnosť než tak urobiť.

Zodpovednosť audítora za audit účtovnej závierky

Našou zodpovednosťou je získať primerané uistenie, či účtovná závierka ako celok neobsahuje významné nesprávnosti, či už v dôsledku podvodu alebo chyby, a vydať správu audítora, vrátane názoru. Primerané uistenie je uistenie vysokého stupňa, ale nie je zárukou toho, že audit vykonaný podľa medzinárodných audítorských štandardov vždy odhalí významné nesprávnosti, ak také existujú. Nesprávnosti môžu vzniknúť v dôsledku podvodu alebo chyby a za významné sa považujú vtedy, ak by sa dalo odôvodnene očakávať, že jednotlivo alebo v súhrne by mohli ovplyvniť ekonomické rozhodnutia používateľov, uskutočnené na základe tejto účtovnej závierky.

V rámci auditu uskutočneného podľa medzinárodných audítorských štandardov, počas celého auditu uplatňujeme odborný úsudok a zachováваме profesionálny skepticizmus.

Okrem toho:

- *Identifikujeme a posudzujeme riziká významnej nesprávnosti účtovnej závierky, či už v dôsledku podvodu alebo chyby, navrhujeme a uskutočňujeme audítorské postupy reagujúce na tieto riziká a získavame audítorské dôkazy, ktoré sú dostatočné a vhodné na poskytnutie základu pre náš názor. Riziko neodhalenia významnej nesprávnosti v dôsledku podvodu je vyššie ako toto riziko v dôsledku chyby, pretože podvod môže zahŕňať tajnú dohodu, falšovanie, úmyselné vynechanie, nepravdivé vyhlásenie alebo obídenie internej kontroly.*
- *Oboznamujeme sa s internými kontrolami relevantnými pre audit, aby sme mohli navrhnúť audítorské postupy vhodné za daných okolností, ale nie za účelom vyjadrenia názoru na efektivnosť interných kontrol Spoločnosti.*
- *Hodnotíme vhodnosť použitých účtovných zásad a účtovných metód a primeranosť účtovných odhadov a uvedenie s nimi súvisiacich informácií, uskutočnené štatutárnym orgánom.*
- *Robíme záver o tom, či štatutárny orgán vhodne v účtovníctve používa predpoklad nepretržitého pokračovania v činnosti a na základe získaných audítorských dôkazov záver o tom, či existuje významná neistota v súvislosti s udalosťami alebo okolnosťami, ktoré by mohli významne spochybniť schopnosť Spoločnosti nepretržite pokračovať v činnosti. Ak dospejeme k záveru, že významná neistota existuje, sme povinní upozorniť v našej správe audítora na súvisiace informácie uvedené v účtovnej závierke alebo, ak sú tieto informácie nedostatočné, modifikovať náš názor. Naše závery vychádzajú z audítorských dôkazov získaných do dátumu vydania našej správy audítora.*

- *Budúce udalosti alebo okolnosti však môžu spôsobiť, že Spoločnosť prestane pokračovať v nepretržitej činnosti.*
- *Hodnotíme celkovú prezentáciu, štruktúru a obsah účtovnej závierky vrátane informácií v nej uvedených, ako aj to, či účtovná závierka zachytáva uskutočnené transakcie a udalosti spôsobom, ktorý vedie k ich vernému zobrazeniu.*

Štatutárny orgán je zodpovedný za informácie uvedené vo výročnej správe, zostavenej podľa požiadaviek zákona o účtovníctve. Náš vyššie uvedený názor na účtovnú závierku sa nevzťahuje na iné informácie vo výročnej správe.

V súvislosti s auditom účtovnej závierky je našou zodpovednosťou oboznámenie sa s informáciami uvedenými vo výročnej správe a posúdenie, či tieto informácie nie sú vo významnom nesúlade s auditovanou účtovnou závierkou alebo našimi poznatkami, ktoré sme získali počas auditu účtovnej závierky, alebo sa inak zdajú byť významne nesprávne.

Výročnú správu sme ku dňu vydania správy audítora z auditu účtovnej závierky nemali k dispozícii.

Keď získame výročnú správu, posúdime, či výročná správa Spoločnosti obsahuje informácie, ktorých uvedenie vyžaduje zákon o účtovníctve, a na základe prác vykonaných počas auditu účtovnej závierky, vyjadríme názor, či:

- *informácie uvedené vo výročnej správe zostavenej za rok 2023 sú v súlade s účtovnou závierkou za daný rok,*
- *výročná správa obsahuje informácie podľa zákona o účtovníctve.*

Okrem toho uvedieme, či sme zistili významné nesprávnosti vo výročnej správe na základe našich poznatkov o účtovnej jednotke a situácii v nej, ktoré sme získali počas auditu účtovnej závierky.

Informácie o účtovných zásadách a účtovných metódach

- (1) Účtovná závierka bola zostavená za predpokladu nepretržitého pokračovania činnosti.
- (2) Účtovná jednotka uplatňuje princípy a postupy účtovania v súlade so zákonom o účtovníctve a s postupmi účtovania pre organizácie, ktoré nie sú založené alebo zriadené na účely podnikania v zmysle Opatrenia MF SR z 3. novembra 2021 č. MF/011079/2021-74, ktorým sa mení a dopĺňa opatrenie MF SR z 30. októbra 2013 č. MF/17616/2013-74, ktorým sa ustanovujú podrobnosti o usporiadaní, označovaní a obsahovom vymedzení položiek individuálnej účtovnej závierky, termíny a miesto ukladania individuálnej účtovnej závierky a výročnej správy pre účtovné jednotky účtujúce v sústave podvojného účtovníctva, ktoré nie sú založené alebo zriadené na účely podnikania v znení opatrenia z 2. decembra 2015 č. MF/20166/2015-74. Účtovníctvo sa vedie v peňažných jednotkách euro.
- (3) Spôsoby ocenenia jednotlivých položiek majetku a záväzkov.
- Dlhodobý nehmotný a hmotný majetok obstaraný kúpou sa oceňuje obstarávacou cenou. Obstarávacía cena zahŕňa cenu, za ktorú sa majetok obstaral a vedľajšie náklady súvisiace s jeho obstaraním (clo, preprava, montáž, poistné a pod.).
 - Dlhodobý majetok nadobudnutý bezodplatným prevodom pri splynutí, zlúčení, rozdelení alebo získaný zámenou sa oceňuje cenou, v ktorej sa doteraz viedol v účtovníctve. Ak cenu nie je možné zistiť, oceňuje sa reálnou cenou. Dlhodobý majetok obstaraný iným spôsobom (napr. bezodplatne nadobudnutý majetok darovaním) sa oceňuje reálnou cenou. Reálnou hodnotou sa rozumie cena, ktorá sa stanoví kvalifikovaným odhadom, ktorý vychádza spravidla zo súčasnej hodnoty budúcich peňažných príjmov z majetku a budúcich peňažných výdavkov na majetok; diskontná sadzba sa určí ako vnútorná miera návratnosti požadovaná investormi pre daný druh majetku ku dňu jeho ocenenia, za ktorú by sa majetok obstaral v čase, keď sa o ňom účtuje.
 - Zásoby sa oceňujú obstarávacou cenou, ktorá zahŕňa cenu obstarania a náklady súvisiace s obstaraním (clo, preprava, poistné a pod.)
 - Pohľadávky a záväzky sa oceňujú menovitou hodnotou. Ocenenie pohľadávok sa znižuje o nevymožiteľné pohľadávky.
 - Finančné prostriedky a ceniny sa oceňujú ich menovitou hodnotou.
 - Rezervy sú záväzky s neistým časovým vymedzením alebo výškou, tvoria sa na základe opatrnosti a oceňujú sa v očakávanej výške záväzku v sume dostatočnej na jeho splnenie.
 - Výnosy budúcich období sa vykazujú vo výške, ktorá je potrebná na dodržanie zásady vecnej a časovej súvislosti s účtovným obdobím.
 - Opravné položky k pohľadávkam sa tvoria na základe zásady opatrnosti, vyjadrujú prechodné zníženie ich hodnoty.
 - Účtovná jednotka nie je platiteľom dane z pridanej hodnoty. V prípadoch, keď dodávatelia sú platiteľmi DPH, fakturovaná DPH je súčasťou ocenenia dlhodobého majetku, zásob, nákladov.
 - Prepočet údajov v cudzích menách:
Majetok a záväzky vyjadrené v cudzej mene sa prepočítavajú na menu euro referenčným výmenným kurzom určeným a vyhláseným Európskou centrálnou bankou v deň predchádzajúci dňu uskutočnenia účtovného prípadu resp. v deň, ku ktorému sa zostavuje účtovná závierka. Na ocenenie prírastku cudzej meny nakúpenej za menu euro sa použije kurz, za ktorý bola táto cudzia mena nakúpená, alebo referenčný kurz v deň uzavretia obchodu. Na ocenenie prírastku cudzej meny v mene euro nakúpenej za inú cudziu menu sa použije hodnota inej cudzej meny v eurách alebo sa na ocenenie prírastku cudzej meny v eurách použije referenčný kurz v deň uzavretia obchodu.
- (4) Odpisy dlhodobého majetku boli stanovené v súlade so zákonom o účtovníctve. Pri stanovení doby odpisovania sa vychádzalo z predpokladanej doby jeho používania a predpokladaného priebehu jeho opotrebenia. Odpisovať sa začína prvým dňom mesiaca, v ktorom bol dlhodobý majetok zaradený do používania.
