2.3. Výber najvýznamnejších výsledkov vedeckej práce organizácie v roku 2022

Každý výsledok má byť charakterizovaný stručným, všeobecne zrozumiteľným popisom – maximálne 1000 znakov + 1 obrázok; bibliografický údaj uvádzajte rovnako ako v zozname publikačnej činnosti, vrátane IF. Nadpis by mal vystihnúť prínos a význam výsledku – podľa možnosti by nemal byť zredukovaný na názov/nadpis publikačného výstupu.

2.3.1. Výsledky na báze základného výskumu

Vplyv mechanického napätia na magnetizačné procesy v amorfnej zliatine FINEMET

Projekty: VEGA 2/0171/19, VEGA 1/0143/20, VEGA 1/0250/21, APVV-19-0369

Riešitelia: J. Kováč

V práci bol sledovaný vplyv mechanického namáhania na magnetizačné procesy v amorfnej kovovej zliatine. Pre túto štúdiu boli vybrané rýchlo kalené amorfné kovové pásky s nominálnym zložením $\text{Fe}_{73.5}\text{Cu}_1\text{Nb}_3\text{Si}_{13.5}\text{B}_9$ (prekurzor FINEMET). Pri rôznych stupňoch mechanického namáhania vzorky boli pozorované významné rozdiely v magnetických vlastnostiach študovaného materiálu. Pôvod týchto efektov vyplýva zo zmien v dynamike doménových stien. Tieto zmeny sú spôsobené predovšetkým zmenami ich základných vlastností (hrúbka, energia na jednotku plochy steny domény), ako aj zmenami vlastností oblastí vnútorného napätia, ktoré sú prekážkami ich pohybu. Vplyv namáhaných oblastí bol demonštrovaný analýzou vplyvu mechanického zaťaženia na vnútorný demagnetizačný faktor.

2.3.2. Výsledky aplikačného typu

Nanokvapaliny s fullerénom C₆₀ a magnetickými nanočasticami pre aplikácie v transformátoroch

Projekty: VEGA 2/0011/20, APVV-18-0160

Riešitelia: M. Rajňák, K. Paulovičová, M. Timko, P. Kopčanský

Cieľom predkladaného výskumu je zvýšiť chladiacu účinnosť GTL transformátorového oleja pomocou nano-funkcionalizácie feritovými nanočasticami a fullerénom C₆₀. Chladiacu účinnosť funkcionalizovaného oleja sme testovali v jednofázovom transformátore s nominálnym výkonom 5 kVA. Bolo dokázané, že prítomnosť feritových nanočastíc v oleji má za následok zníženie oteplenia transformátora len pri nízkej magnetizácii nasýtenia suspenzie (0,05 Am²/kg). Vysoká magnetizácia nasýtenia (6,4 Am²/kg) a následné magnetické interakcie nanočastíc s magnetickým poľom transformátora vedie k blokovaniu prúdenia oleja a k nárastu oteplenia transformátora [1]. Výrazný pokles oteplenia transformátora až o 8 °C bol dosiahnutý pri aplikácii oleja s fullerénom C₆₀ (0.01 % w/V). C₆₀ v GTL oleji tiež zvyšuje jeho elektrické preskokové napätie až o 17 %, čo môže byť zapríčinené vysokou elektrónovou afinitou fullerénu a schopnosťou potlačiť foto-ionizáciu na čele strímra [2].

2.3.3. Výsledky na báze medzinárodnej spolupráce

Misia BepiColombo: Prvé pozorovanie vnútornej južnej magnetosféry Merkúra

Projekty: VEGA 2/0094/10, VEGA 2/0059/13, VEGA 2/0077/16, VEGA 2/0087/19

Riešitelia: J. Baláž

Merkúr, najbližšia planéta k našej materskej hviezde, intenzívne interaguje s jej korpuskulárnou aj elektromagnetickou radiáciou, čo predstavuje z fyzikálneho hľadiska veľmi zaujímavé dynamické prostredie. Južná vnútorná magnetosféra planéty bola doposiaľ neprebádaným regiónom, keďže nebola skúmaná predošlými misiami MARINER-10 a MESSENGER. Sonda ESA BepiColombo letí k Merkúru od októbra 2018 a na orbite okolo neho zaparkuje v decembri 2025, čomu predchádza 6 gravitačných asistencií - blízkych preletov popri tejto planéte. Počas prvého preletu 1. októbra 2021 sonda preletela južným regiónom vo výške 199 km, kde iónové senzory PICAM a MIPA vedeckého komplexu SERENA zaregistrovali unikátne dáta o distribúcii a dynamike iónov. Misia BepiColombo je objektom spolupráce európskej vesmírnej agentúry ESA a japonskej JAXA v hodnote 2 mld €. Aparatúra SERENA (*Search for Exospheric Refilling and Emitted Natural Abundances*) je objektom spolupráce 34 inštitúcií (vrátane ÚEF SAV, v. v. i.) zo 16 krajín.

2.11. Iné informácie k vedeckej činnosti.

Oddelenie subjadrovej fyziky

GRID Computing for the LHC experiments at IEP SAS Kosice:

- Pracovné uzly/počet jadier: 53 / 832
- Disk space ALICE+ATLAS: 1.25 PB + 1.25 PB
- Spracovaných úloh: 2 063 247

Experimenty na LHC v 2022:

- Hlavným cieľom v roku 2022 na experimentoch v CERN na LHC bol commissioning experimentov a začiatok zberu dát pre fyzikálnu analýzu Run-3. Počas druhej dlhodobej odstávky LHC, ktorá skončila v roku 2021 boli mnohé experimentálne komponenty experimentu ALICE vymenené a modernizácia sa nevyhla ani experimentu ATLAS.
- Všetky časti infraštruktúry, hardvérové aj softvérové, boli doladené do plne funkčného stavu.

Central Trigger Processor (CTP) pre experiment ALICE v Run-3 (M. Krivda):

- Dokončenie inštalácie CTP hardware v experimente.
- Vývoj a testovanie firmware pre CTP readout.
- Vývoj a ladenie firmware pre CTP core logic.
- Návrh a testovanie PLL konfigurácie pre hitless clock switching pre detektory ITS a TPC.
- Návrh firmware a ladenie kalibračného mechanizmu pre detektory ALICE.
- Modifikácia TTC-PON firmware pre CTP FPGA štruktúru.
- Vývoj a testovanie firmware pre 240 MHz clock pre TICG modul (trigger generator and a clock generator).

Experiment ATLAS:

- Výrazný príspevok k úspešnému rozbehu LAr kalorimetra detektora ATLAS -validácia softwaru a conditions, migrácia softwaru na nový framework, konsolidácia spracovania kalibračných dát, atď.
- LAr kalorimetrom bolo získaných približne 38 nb-1 dát vhodných na fyzikálnu analýzu, na čom sme mali relatívne veľký vklad - smeny na prevádzke detektora, elektronická kalibrácia, smeny na data quality, tréning nových študentov na LAr software, atď.
- Nová posila Dominik Babál (Juraj Smieško je na fellowship v CERNe) pracuje na ttZ analýze a začal sa zaučať do LAr data quality softwaru.
- Prispeli sme k validácii modelov hadrónovej fyziky simulačného frameworku Geant4 (spoločná publikácia tento rok: L. Pezzotti, A. Kiryushin, D. Konstantinov, A. Ribon, P. Stríženec and Geant4, Including Calorimeter Test Beams in Geant-val - The Physics Validation Testing Suite of Geant4, Instruments 6 Issue 3, 41, 2022).
- Pokračuje naše zapojenie do koordinačných funkcií v ATLAS (LAr software and data preparation coordinator, LAr Group Representatives chair).

Oddelenie kozmickej fyziky

Konštrukcia experimentálnej techniky - fotometre EMON (4ks) pre balónovú misiu NASA-SPB2.

Oddelenie materiálovej fyziky:

Rozvoj experimentálnych techník:

- Systém pre RTG difrakčnú analýzu (J. Bednarčík, O. Milkovič, V. Kuchárová, R. Smolko): difrakčné analýzy pre ÚEF SAV, v. v. i. (OFMJ, CFNT), PF UPJŠ, FMMR TUKE, ÚMV a ÚGT SAV, v. v. i.

25th Soft Magnetic Materials Conference, Grenoble, France, 150 účastníkov, 02.05.-05.05.2022

The SMM is the largest international conference devoted to soft magnetic materials. It is held every two years in a different country. The conference series has an International Organising Committee. The main aim of the SMM25 was to bring together scientists and engineers from universities, research institutions and industry who are active in research, development and industrial applications of the soft magnetic materials. The programme of the conference included invited lectures by academic and industrial experts, oral presentations and poster sessions for regular contributions. The proceedings of SMM25 will be published as Special Issue in Journal of Magnetism and Magnetic Materials (Elsevier) at the beginning of 2023.

Ústrednými témami konferencie boli súčasné problémy kvantovej fyziky - kvantovej teórie magnetizmu spinových a elektrónových štruktúr, exotických kvantových spinových stavov, kvantového previazania, kvantových fázových prechodov, topologického kvantového počítania a kvantového spracovania informácie. Účastníci workshopu prezentovali originálne pôvodné výsledky svojho výskumu, ktoré môžu zásadným spôsobom ovplyvniť vývoj budúcich kvantových technológií.

EMP User meeting 2022, Štrbské Pleso, Vysoké Tatry, Slovensko, 52 účastníkov, 18.09.-22.09.2022

The aims of the fourth EMP User meeting 2022 are similar as all three previous ones: to bring together current and hopefully also other potential future users of experimental facilities provided by the EMP consortium and inform each other on achievements, results obtained and problems raised with implementation of the TNA activity.

This 3 days workshop served as a good tool and place for the exchange of ideas and information. But not only for this: we also hope that fruitful discussions and sharing our individual TNA experiences with each other have supported the dissemination of the idea of the TNA activity, and in the end also help to attract new external users. We also included a session focussed on innovation and technological activities covered by the tasks INNO Work Package. Here, academic, technical and industrial partners who are working together on development techniques and technologies and their transfer from the lab bench to commercial products attended this meeting.

7th International Conference "Models in Quantum Field Theory" (MQFT-2022), Petrohrad, Rusko, 50 účastníkov, 10.10.-14.10.2022

MQFT is a biennially held international conference this year dedicated to the 82nd anniversary of professor Alexander Nikolaevich Vasiliev (1940-2006) and 80th anniversary of professor Vladimir Dmitrievich Lyakhovsky (1942-2020). From year to year, the conference attracts the most distinguished members of the world-famous centres for theoretical physics. The main topics of the conference are related to the most actual and important problems related to the construction and investigation of the quantum field theory models. During the conference, it is proposed to discuss the modern methods of QFT and applications of these methods to the elementary particle physics and statistical physics, gravitation and cosmology, mathematical problems and methods in quantum field theory, and integrable models.

During the conferences, the special importance is placed upon the methods and approaches created and developed by the researchers of “Vasiliev scientific school”, the school of theoretical physics that was established by Alexander Nikolaevich Vasiliev and has since then acquired an international scope. Currently, as many as 10 professors and 20 Ph.D. researchers belong to the school. Their successful work in the field of theoretical physics is conducted either in Russia or around the world, many of them have developed their own methods and approaches and acquired many students of their own. Results obtained by A.N.Vasiliev and his followers revealed the deep intrinsic affinity between classical complex systems with many degrees of freedom and quantum objects, which allowed to apply successfully the powerful mathematical methods of the quantum field theory to the phenomena of seemingly completely different nature.

This year the conference included an extended section on the mathematical foundations of quantum field theory that is dedicated to the 80th anniversary of professor Vladimir Dmitrievich Lyakhovsky (1942-2020), who was a close friend of Alexander Nikolaevich Vasiliev and the organizer of the first MQFT conferences. In this section we welcome contributions that are related to the scientific interests of Vladimir Dmitrievich: representation theory, symmetries in QFT, quantum integrable systems, quantum groups.

4.4. Najvýznamnejšie prínosy MVTS ústavu vyplývajúce z mobility a riešenia medzinárodných projektov a iné informácie k medzinárodnej vedeckej spolupráci

NATO G-5683

Projekt sa venuje vývoju a príprave nových nanokompozitov určených pre liečbu chorôb po akútnom ožiarení. Pozornosť sa zameriava na kombinované použitie neobalených nanočastíc oxidu céria (CeO_2 NPs) a vysokoaktívneho uhlíkového enterosorbentu určeného na perorálne užitie. Riešením úloh projektu sme ukázali, že fyzikálno-chemické parametre syntetizovaných CeO_2 NPs je možné kontrolovať vhodnou úpravou reakčných podmienok. Potvrdili sme koreláciu medzi veľkosťou a percentuálnym podielom Ce^{3+} iónov na povrchu častíc, ktoré ovplyvňujú aj ich bioaktivitu. Ukázali sme, že vďaka jedinečným vlastnostiam, schopnosťou ovplyvniť amyloidogézu proteínov a pseudoenzymatickou (antioxidačnou) aktivitou, sú nanočastice CeO_2 vhodným kandidátom pri štúdiu procesov sprevádzajúcich choroby po akútnom ožiarení, ale aj choroby súvisiace s vekom. Významným aspektom pri použití nanočasticových systémov je aj ich odozva na externé elektrické a magnetické pole. Ukázali sme tiež, že aplikácia striedavého a/alebo rotujúceho magnetického poľa vedie k tvorbe tepla v procesoch hypertermie, čím je možné zvýšiť ich terapeutický účinok. Očakávame, že výskum povedie k dizajnu nových účinných (aktívnych) preparátov pripravených na testovanie v predklinických štúdiách.

SK-TW AZCAI

Jedným z najatraktívnejších moderných farmaceutických prístupov je použitie multifunkčných materiálov. V rámci projektu sa zameriavame hlavne na využitie zeolitov na báze klinoptilolitu (CZ). Mezoporéna štruktúra klinoptilolitu umožňuje absorbovať rôzne typy látok, vrátane nanočastíc a teda, CZ-kompozity môžu byť použité ako sľubné biokompatibilné nosiče pre cielené podávanie liečiva s riadeným uvoľňovaním. Skúmali sme a porovnávali vplyv fluorescenčných látok samostatne a aj vo forme kompozitov CZ na amyloidogénu inzulínu, biokompatibilitu, bunkovú metabolickú aktivitu a fluorescenčnú farmakokinetiku. Pozorovaná bola vysoká biokompatibilita a uvoľniteľnosť naviazaných látok z kompozitov smerom k bunkám a tkanivám. Vzhľadom na fotoaktívne vlastnosti použitých farbív môžeme predpokladať ich využiteľnosť aj vo fotodiagnostike a fotodynamickej terapii. Navyše, zeolity disponujú anti-oxidačnou kapacitou, čím môžu prispieť k štúdiu zapojenia oxidačného stresu do chorôb súvisiacich s amyloidogézou a eliminácii negatívnej redoxnej rovnováhy, čo môže byť kritickým krokom pri starnutí a chorobách súvisiacich so starnutím, vrátane amyloidóz. Terapeutický potenciál multikompozitov obsahujúcich magnetické častice, fotoaktívne látky je možné riadiť a kontrolovať, obzvlášť pri ko-aplikácii externého žiarenia, resp. magnetického poľa, ultrazvuku a podobne. Ukázali sme, že aplikácia striedavého a/alebo rotujúceho magnetického poľa vedie k tvorbe tepla v procesoch hypertermie.

MVTS AMAZON

Projekt je zameraný na návrh inovatívneho neinvazívneho prístupu diagnostike a monitorovaniu progresu neurodegeneratívnych ochorení, pre ktoré je charakteristická prítomnosť amyloidných štruktúr, využitím multikompozitov na báze zeolitov. Ukázali sme, že mezoporéna štruktúra zeolitu klinoptilolitu poskytuje jedinečnú platformu na prípravu multifunkčných sond, s anti-amyloidnou aktivitou, ale aj možnosťou využitia cieleného transportu liečiv, ale aj na optické a magnetické zobrazovanie. Ako perspektívne sa javí tiež využitie vo fototerapii, pri hypertermii so súčasným použitím ultrazvukovej transmisnej tomografie.

Výsledky získané počas celej doby riešenia úloh projektu viedli k publikovaniu 20 pôvodných vedeckých prác a boli podkladom v príprave pokračujúceho projektu MVTS (Azcai „*Anti-amyloid activity of zeolite-based composites and analysis with real-time 3D super-resolution imaging*“).

5. Koncepcia dlhodobého rozvoja organizácie

5.1. Odporúčania z posledného pravidelného hodnotenia organizácií SAV (akreditácie)

Akreditácia ÚEF SAV, v. v. i. sa konala 20. 10. 2022 v Aule ústavov na Watsonovej 47 v Košiciach. Na základe uznesenia Predsedníctva SAV č. 501.C zo dňa 15. decembra 2022 sa zaraduje ÚEF SAV, v. v. i. do kategórie "B" s charakteristikou:

Výskum je viditeľný na európskej úrovni. Organizácia prispieva hodnotnými výsledkami k rozvoju oblasti v Európe

General comments on the Institute performance (2016-2021):

The institute was very successful at the national level with APVV grants, has increased its publication activity and also the citations impact compared to the previous evaluation period. Positive is the increase of publications in Nature index journals. However, IEP members played mainly a supporting role in the publications, not leading. On the international level the members of the institute intensively applied for high-level EU funding, although without greater success. The institute plays a very relevant social function in the region, contributing results of relevant applied research and educating public via popularization and outreach. The PhD programs associated with the institute and the cooperations with universities are very good. The strategies are broadly outlined in 4 main directions, but the corresponding analysis of the structural match is not provided. The research appears too fragmented to be competitive at the EU level, lacking strong focused groups with critical mass to be able to assume leading roles.

Comments and recommendations for further improvement and development of the institute:

- The panel notes that the previous recommendation, "Increase focus on the strategic actions/changes/improvement by setting up measurable goals and milestones" has not been convincingly addressed. This recommendation holds for the next period as well. While further increasing the number of Nature index publications, set a target for the fraction of the publications in which the institute has leading role.
- Consider if focusing on more perspective research directions and deemphasizing/reorienting less exposed ones could lead to the needed critical mass to become potentially leading and competitive on the European scale.
- Access if the fragmented departmental structure is in line with the few strategic directions. Joining some departments and forming strong groups within could be an alternative.
- Introducing research group should be also encouraged in the next period. At the moment there seems to be no systematic policy for their development, so the institute needs to seek potential group leaders actively. Consider introducing a systematic way to form research groups.
- The panel recommends building a more ambitious IAB by appointing renowned scientists - geographically diverse and also with an eye on the gender balance - from relevant disciplines.
- The institute should consider licencing and industrial contracts to enhance its economic and social impact.
- The institute should consider having a regular seminar/colloquium program to help knowledge transfer and informing of current topics.
- Consider further measures to increase the number of PhD students. The institute has taken some steps already.

5.2. Hlavné body Akčného plánu organizácie a stav ich plnenia

Nový Akčný plán ešte nestihol byť vytvorený a schválený VR ÚEF SAV, v. v. i., keďže výsledok akreditácie a s ním spojené odporúčania Metapanelu boli známe až 19. 12. 2022. Nový Akčný plán bude vytvorený v prvej polovici roka 2023.

5.3. Aktualizácia Akčného plánu organizácie v roku 2022

Namiesto aktualizácie Akčného plánu je tu uvedená Stratégia výskumu a budúceho rozvoja ústavu na obdobie ďalších 5 rokov:

The Institute of Experimental Physics (IEP) of the Slovak Academy of Sciences (SAS) in Košice is one of the leading centers for physics-related research in Slovakia. This institute is a home-base for researchers who are nationally and internationally recognized for their contributions to scientific advancement. Research performed at the institute grows gradually in its quality and impact in the long term. In the next period, the institute will strive to keep up with fast changing world in order to respond to challenges the world is facing in technological, environmental and public health domains. Innovations using quantum technology, targeting diverse topics spanning from exploration of vaccines to climate change, have the power to outperform any existing technologies; biotechnology, as another example, enables new solutions in tackling diseases or cleaning up pollution.

The research at the Institute within the next five years will be closely connected to various contemporary challenges. As highlights we mention some of them: we will take part in the national framework for the new rapidly developing field of quantum communication infrastructure and quantum computation; biotechnology will be addressed via development of new textile composite (nano)materials, new therapies for amyloid-related diseases or lab-on-chip applications; environmental issues will be dealt with in research leading to enhancement of energy savings and improvement of energy harvesting, including the development of new hydrogen storage methods for various applications including zero-emissions vehicles. Research groups of the institute will also continue being the important integrant in large international space missions and experiments (ESA JUICE, JEM-EUSO), as well as in ALICE and ATLAS experiments at CERN.

We are also aware that the rising fear of new technologies and lack of public trust in science in general, despite of the tremendous advances they have already provided, may prevent innovations from having the impact they promise. We are committed to increasing the efforts to educate and engage the public to ensure that science and technology truly live up to their potential.

In order to meet our goals and make the most of the effort, the institute will support following activities: i) basic research in order to expand human knowledge, ii) international collaborations, especially (but not exclusively) under the European flagship projects; iii) research activities that have a potential of rapid transfer of knowledge from basic research into innovative products and technologies; iv) expanding the expertise of the research personnel; v) the teaching and training of students at different education stage; vi) the scientific popularization on the regional and national level.

IEP SAS also plans to be active on national/regional level by providing its expertise in the Cassovia New Industry Cluster (CNIC), a very recent endeavour of three Košice universities, three research institutes of SAS (including IEP SAS) established in Košice, University hospital of Košice, Regional government, City of Košice and private companies (<https://cnic.sk>). The goals of the CNIC project are based on a synergy of excellent knowledge presented in the region, and the creation of instrumentation and infrastructure for top research and technology transfer to industry in the fields of biomedicine, materials research, quantum & information technologies, green energy & digital technologies.

Research strategy of the scientific departments

Centre of Low Temperature Physics (CLTP)

CLTP as a member of the most prestigious club of the world low temperature laboratories – the European Microkelvin Platform (EMP) will remain an open access point for academic researchers willing to experiment at ultralow temperatures using unique in house developed infrastructure capable for investigating quantum materials and technologies. Our participation in EMP project shifts the development of unique experimental methods to their cutting edge and opens new collaborations in the field of low temperature physics and quantum technologies. CLTP is a key partner of the Slovak National Research Platform on Quantum Technologies - QUTE (<http://qute.sk>) that is creating a national framework for the new rapidly developing field of quantum communication infrastructure and quantum computation. Just recently, our consortium has applied for a new project – skQCI within EU call: DIGITAL-2021-QCI-01 related to EU Secure Quantum Communication Infrastructure, part of the EuroQCI mission. Realisation of this project will enable to build up the quantum communication infrastructure across the whole country. In the near future we would like to continue and focus our work on forefront research at low and ultra low temperatures and transfer of knowledge from fundamental research to application. In particular, we shall carry on research and application of quantum systems as model structures for study and simulation of physical processes that currently are beyond mankind technological capabilities. We plan to investigate also nontrivial physical processes of various quantum systems that are emerging as a consequence of their topological behaviours, and are represented e.g. by Majorana particles – fundamental elements of Q-bits, by interplay with magnetism, topology and superconductivity, quantum criticality, etc. Our new Impulz project “Topological superconductivity in quantum 2D devices - TopoQ2D” and the new Quantum Materials research laboratory, built in the framework of this project will play a key role in this research. Focus on quantum nanotechnology, quantum materials / systems and quantum communication infrastructure, including quantum computing is going to be a key pillar of research at CLTP IEP SAS in the near future. The research will continue also in investigations of the metallic geometrically frustrated magnetic systems as well as superconducting properties of 3D/2D rare earth borides or high-entropy alloys, respectively.

Department of Materials Physics

The main activity will be focused on REBCO bulk single-grain superconductors. Research will be implemented within national projects (APVV, VEGA) and in cooperation with CAN Superconductors a.s. manufacturer of bulk superconductors and will focus on improving macroscopic superconducting properties in combination with mechanical properties. Special attention will be paid to the study of the possibilities of simultaneous optimization of the efficiency of pinning centres and prevention of crack propagation in these brittle ceramic materials. We will focus on optimizing the particle size distribution of pinning centres in the form of non-conductive particles RE211. Our results to date suggest that an optimized bimodal RE211 particle size distribution may lead to the expected effects. The quality of the boundary between two REBCO bulk crystals grown from two seeds will also be studied to optimize the properties of large multy-seeded REBCO bulks. This activity will be coordinated with cooperating foreign laboratories (mainly University of Cambridge, SIT Tokyo, University of Caen, JIU Shanghai) and we plan to apply for a European project as a partner of CAN Superconductors a.s. In cooperation with a small company RV Magnetism a.s. and Pavol Jozef Safarik University in Košice we will study the structure and microstructure of magnetic Heusler alloys in the form of glass coated micro-wires suitable for application in sensors (joint project).

Department of Magnetism

Magnetic fluids as one of the pioneers of modern nanotechnology are still attractive for basic as well as applied research. Magnetic fluids and their composite systems have stimulated further research, especially in the field where nanoparticles, especially magnetic ones, give them the ability to manipulate them in an external magnetic field, thus changing the properties required in various applications:

- The hybrid materials based on liquid crystals (LCs) doped with magnetic nanoparticles (MNPs) reveal a great potential to improve current liquid crystal-based technologies. In this context, further enhancement of the sensitivity to the magnetic field may be achieved by long-term colloidal stabilization of larger MNPs with improved magnetic properties. Moreover, LC-mediated assembly of nanoparticles may not only lead to LCs with ferromagnetic properties but also to novel and complex, nanoparticle-based superstructures. The parameter space is large which opens up many possibilities for future studies on active matter and programmable liquid constructs.

- Novel alternative cooling and insulating liquid media such as oils based on liquefied natural gas, natural esters and new types of transformer oils. We will prepare novel nanofluids based on these oils by dispersing magnetic nanoparticles (fullerenes, graphene nanoplatelets or carbon nanotubes) for enhancing the cooling effectiveness. The nanofluids will be investigated from dielectric, insulating, magnetic and heat transfer properties point of view. Finally, their cooling effectiveness will be tested in loaded power transformers. Therefore, the future research is believed to contribute to the development of advanced liquid media for cooling and insulation in electrical engineering, the application of which will have a potential impact on electric power saving, electrical equipment service life and protection of the environment.

- The research on ferrofluids for electrical engineering applications will be focused on energy saving and energy harvesting. Novel hybrid ferrofluids based on insulating liquids will be developed with the aim to obtain highly efficient cooling and insulating liquid medium for electrical devices. The research will be also oriented on thermal-to-electric energy conversion by developing ferrofluids based on ionic-liquids; i.e., colloidal dispersions of magnetic nanoparticles in ionic liquids. The third research activity will be devoted to investigation of ferrofluids for mechanic-to-electric energy conversion in wearable devices.

- One of the aims in future research is the development and preparation of new textile composite (nano)materials (usually exhibiting magnetic response), their detailed characterization, and subsequent use in various fields of biosciences, biotechnology, (bio)analytical chemistry, medicine and environmental technologies. (Nano)textile materials can be functionally modified by modifying the polymer, fiber, and textile structures by application of chemical, physical, and biological treatments, in order to develop textile materials applicable in wide range of applications. In addition, the incorporation of ferro- or ferrimagnetic (nano)particles (e.g. magnetite or maghemite (nano)particles by magnetic fluid treatment or using microwave assisted synthesis) or a piece of magnetic iron wire into parts of modified (nano)textiles allows them to be separated very quickly and with 100% recovery even from large volumes of solutions and suspensions, using appropriate magnetic separator. Modified textile materials (both in magnetic and nonmagnetic form) can find very important applications in many areas of biosciences, biotechnology, (bio)analytical chemistry, catalysis, medicine and environmental technology.

We are going to continue in study of multiferroic and another functional materials with perovskite structure in respect to hydrogen storage or application of colloid with nanoparticles for hyperthermia. The future projects will be targeted to substitutional solid solutions and construction of magnetic phase diagrams in RTO_3 system ($\text{R} = \text{Nd, Pr, Sm, Tb, Dy}$ and $\text{T} = \text{Ti, Cr, Mn, Fe}$). Oxygen content affects physical properties of this system. The defect structure can be used for hydrogen storage. Experimental techniques like crystal growth of single crystals, synthesis of magnetic nanoparticles and study of various physical properties are complemented by theoretical approach using Density functional theory. Our project will serve as starting point for re-examining the effect of oxygen content on physical properties of RMnO_3 multiferroic compounds. The concept of storing hydrogen in the vacancies of these compounds is novel as well smart hyperthermia based on colloid containing magnetic nanoparticles of manganites.

Department of Applied Magnetism and Nanomaterials (DAMN)

The research activities of the DAMN will focus on development of novel soft and hard magnetic nanocrystalline alloys and composites with potentially improved application-oriented properties. Their desired properties will be achieved by targeted compositional, structural and shape modification and by the choice of optimal thermomagnetic treatment. Here of particular interest will

be the employment of two unconventional techniques of thermal processing constructed recently by our group at IEP SAS. We plan to use new facility for ultra-rapid annealing of thin metallic ribbons where typical annealing times take few seconds. High heating rates and much shorter processing times as compared to conventional annealing allow to extend the composition interval where the annealed melt-spun ribbons are still capable to form nanocrystalline structure. The second technique for unconventional thermal processing of materials available at our department is the annealing of materials in presence of high magnetic fields (up to 14 T). We hope that the utilization of the above-mentioned unconventional processing techniques will help us to develop new materials with interesting combination of structural and magnetic properties. Our attention will be also devoted to nanocrystalline alloys in the form of bilayer ribbons prepared by a double-nozzle planar flow casting technique, which offers the possibility of simultaneous formation of two homogeneous layers connected through solid interface, with different composition and uniform thickness along the ribbon length. The resulting bilayer ribbons are interesting for their intrinsically graded functional properties, which can be used in design of specific sensors or actuators.

Department of Biophysics

The long-held structure-function paradigm where well-defined native protein structures are needed for their function has been considered the “Holy Grail” of structural biology for a long time. This approach is valid for structurally well-defined proteins called globular proteins. However, recent data demonstrate a large proportion of the proteins from all domains of life, which are rich in sequences that do not fold into regular structures, commonly known as nonglobular proteins (NGPs). NGPs comprise intrinsically disordered regions, repeats, low-complexity sequences, aggregation-prone and phase-separating sequences. NGPs participate in many biological processes of DNA and RNA binding, transcription, translation, cell-cycle regulation and signaling. NGPs also play a central role in age-related amyloid-related diseases and systemic disorders such as Parkinson's and Alzheimer's and type II diabetes. We plan to understand the protein sequence-structure-dynamics-function relationship at the molecular/atomistic level using biophysical experimental and computational techniques. We will focus on the role of hydrophobic interactions in formation and stability of protein amyloid structures and clarify a link between oxidative stress and amyloid fibril formation. Moreover, we will search for the effective inhibitors of the amyloid aggregation. This integrative approach will provide new therapies for amyloid-related diseases.

Amyloid aggregates formed by proteins also constitute a robust platform with a large potential for engineering applications and novel biomaterials such as amyloid fibril networks, amyloid-based layers or gels for applications such as drug delivery, controlled release of active drugs from amyloid conjugate, tissue repair/engineering, metal nanowires, and biosensors. We will also utilize the full-length native globular proteins such as insulin, lysozyme, and α -lactalbumin to create fibrillar templates and networks with controlled properties. Amyloid structures have a high affinity for a wide range of nanoparticles. We plan to study the potential of amyloid-NPs ((Au, Ag, Pd as core) based hybrid for catalytic properties for reduction, oxidation, or C-C coupling of important industrial reactions.

In parallel, the formation of functional amyloid structures based on spider silk protein will be studied. We plan to engineer spider-amyloid based nanocomposites for biomedical and biotechnological applications (fabricate the spider silk-based nanocomposites able to: a) immobilize proteins; b) act as nanoparticles or drug carriers).

In the near future, we plan to develop biomedical lab-on-chip (LOC) applications based on light-driven mechanical microstructures fabricated by two-photon polymerization and integrated into the microfluidic LOC environment. We are especially focused on flexible (deformable) micro-structures that have not been used in biomedical applications yet. Two well-defined LOC application areas are targeted: micro-rheology and single-cell manipulation. Our main goal is the development of micro-viscometers utilizing the effect of the surrounding fluid medium on the deformation (deflection) of flexible micro-cantilevers. Two types of structures will be prepared: a) anchored to the bottom glass surface and b) optically movable ones placed inside the micro-fluidic system. Such light-driven elastic micro-robots should be able to capture, transport, and release single

live cells. Their function will be automated to build multicellular systems, mimicking the tissue conditions autonomously. To facilitate the flexible microstructure development and optimization, the material properties of the photo-polymers will be determined by comparing experimental deformation data with the results of numerical simulations.

Cancer is the second leading cause of death after cardiovascular disease in almost all European countries. Over the past several decades, the principle types of cancer therapies have been chemotherapy, radiation therapy, and surgery. The magnetic nanoparticles represent great potential in the diagnosis and treatment of cancer due to their unique properties, such as their biocompatibility, simple fabrication technology, and the ability to be manipulated with an external magnetic field. In this context, we plan to continue developing biocompatible multifunctional magnetic nanoparticles and evaluate their diagnostic and therapeutic potential for application in oncology. The first key step to achieving the desired goal will be the synthesis of magnetic nanoparticles and the functionalization of their surface with biocompatible materials suitable for radioactive indicator binding to monitor their biodistribution using radioactive indicator methods in healthy rats. Moreover, the stability of radiolabeled MNPs in vitro will be investigated. The second important goal will be to conjugate chemotherapeutic drugs of natural origin such as betulinic acid and / or hypericin to magnetic nanoparticles as a new approach to cancer treatment. The suitably selected nanoparticles with the immobilized drug could enhance chemotherapy efficacy by increasing drug concentration at the target site, so they could reduce its adverse effects or enhance the detection sensitivity. Moreover, a combination of MRI, hyperthermia, and radiotherapy with magnetic drug targeting could represent a significant advance in cancer disease treatment and a substantial improvement in the survival of oncological patients.

Department of Experimental Chemical Physics

The strategy in this department will be to follow up on the successful patent activity from recent years. Three patents were awarded and three patents are currently pending. Since these patents relate to food safety and drug safety, we plan to work closely with state authorities in the area of contaminants screening and with the private sector in the area of contaminants removal (product purification). Paradoxically, all patent outcomes came from our long-term purely basic research focused on interesting, yet poorly understood and puzzling physical phenomena in chemical systems. Methodologically, our department is focusing on the characterization of macromolecular and nanoparticle systems, especially in situations where the nature/origin of nanoobjects is unknown. Given the commercial infrastructure, original in-house developed methods, and methodological expertise, our department represents a unique workplace in this area at national level. Within the Cassovia New Industry Cluster (CNIC), we plan to broaden our methodology portfolio by acquiring small-angle x-ray scattering (SAXS) equipment. Our research focus will be on potential existence of stable bulk nanobubbles. While it is currently not exactly known if such nanoobjects can really exist and at which conditions, their application potential is tremendous. While microbubbles are currently used as USG contrast agents for blood circulation visualization, nanobubbles would help to visualize tissues, including tumor issues and other pathological tissues since nanobubbles can penetrate the smallest blood vessels.

Department of Space Physics

The research strategy of DSP will in the next years focus on cosmic rays, space weather, and ionospheric research. The objectives are to apply machine learning methods, mainly in the space weather field, and build open-source models with web service for all cosmic rays models developed at DPS in the last decades. We will give high importance to continuation of the experiments and measurements realized by DSP, such as experiments at the detached observatory of the institute at Lomnický štít (neutron monitor, SEVAN), and participation in space experiments as ESA JUICE mission and JEM-EUSO experiment.

Department of Subnuclear Physics

The future research activities of the Department of Subnuclear Physics will continue to be focused on the experimental programme at CERN with the emphasis given to the ALICE and ATLAS experiments. The ALICE experiment underwent a major upgrade of many subdetectors and systems

and is now ready for the forthcoming long data taking period. The ATLAS experiment expects its major upgrade later. In order to reach rarer physical processes, the Large Hadron Collider is lead towards a High Luminosity LHC which will reach its operational stage in around 2029. In the next 5 years physicists from IEP SAS will participate in data taking, hardware and software development and physics analysis, and also in adaptation of all computing facilities - including GRID farm at IEP SAS - to fulfil growing demands. In the more distant future, there are plans to build a successor of the ALICE detector and keep the ATLAS in shape for HL-LHC.

Department of Theoretical Physics

Further theoretical studies in the area of condensed matter physics will be focused on:

- (i) Description of cooperative phenomena in strongly correlated electron and spin systems. The special attention will be paid to specifying the key mechanisms which lead to formation and stabilization of inhomogeneous charge and spin ordering, superconductivity, itinerant ferromagnetism, ferroelectric and magnetocaloric phenomenon due to the big application potential of these phenomena and their possible coexistence. The study will be performed on the comprehensive model, which will take into account all relevant interactions in rare-earth and transition metal compounds, where besides the spin-independent Coulomb interaction in d and f band also the spin dependent (double exchange) interaction between both bands will be included. For a solution of this model we plan to elaborate new numerical methods, which will be subsequently used in combination with standard methods of quantum statistical physics (DMRG and QMC) to study the above-mentioned phenomena.
- (ii) We will continue with investigations of magnetic and thermodynamic properties of various theoretically as well as phenomenologically interesting magnetic frustrated systems. Our aim will be, especially, to investigate in detail the efficiency of the adiabatic (de)magnetization cooling processes in such frustrated magnetic systems. Within the area of non-linear stochastic dynamics, we will continue with the fundamental investigation of the universal scaling properties of various correlation functions of scalar, magnetic, and vector fields in turbulent environments described by Gaussian as well as non-Gaussian statistics of the velocity field with the presence of various types of symmetry breaking.
- (iii) In the next period we will also plan to continue in the study of low-dimensional pure quantum systems with a stress on the study of a quantum and thermal entanglement, magnetocaloric and multicaloric effect. Our interest will be focused on quantum systems with a mixed spin constituent and the size of a quantum system. Beside this, we will contribute to the study of 2D van der Waals materials utilizing state-of-the-art methods.

V rámci štúdia ladenia vlastností kvantových magnetov sú po recenzii publikácie týkajúce sa skúmania magnetickej štruktúry skenovacím tunelovým mikroskopom v systéme TmB4 [1] a vplyvu rotácie tohto systému v magnetickom poli na jeho magnetorezistivitu [2].

Všetci slovenskí riešitelia projektu absolvovali služobnú cestu do HZB Berlín v období 23. 5. - 3. 6. 2022. Počas pobytu boli študované transportné a magnetické vlastnosti frustrovaných kvantových magnetov v extrémnych podmienkach do teplôt 300 mK a v poliach do 14 T na zariadeniach He4-PPMS-14T a He3-SQUID VSM-5T (Quantum Design).

Zároveň náš ústav navštívil Dr. K. Siemensmeyer v období 10. - 15. 7. 2022 za účelom experimentálneho a teoretického štúdia magnetických dimérov v tetraboridoch vzácnych zemín.

Na partnerskom pracovisku Wigner Research Centre for Physics, Budapešť, Maďarsko bola vedená diskusia ohľadom pripravených ferenematických vzoriek- nematické kvapalné kryštály dopované magnetickými nanočasticami, spojená s vyhodnotením nameraných dát. Konkrétne bola študovaná orientácia molekúl kvapalného kryštálu v okolí magnetickej nanočastice. V rámci plánovaného pobytu zahraničných hostí na našom pracovisku boli premerané vzorky nematických kvapalných kryštálov dopovaných chirálnym dopantom (tzv. cholesterík) pomocou polarizačného optického mikroskopu s cieľom nájsť optimálnu koncentráciu chirálneho dopantu pre prípravu stabilných cholesterických kvapalných kryštálov, ktoré by vykazovali vysokú odozvu na nízke rozsahy el. a mag. polí. Boli tiež pripravené fotosenzitívne polyméry na báze nematických kvapalných kryštálov, na ktorých bola študovaná fázová transformácia pomocou atómovej silovej mikroskopie. Získané výsledky boli následne prediskutované, kde v rámci diskusie boli zhodnotené dosiahnuté výsledky pri riešení projektov a predniesli sa plány na ďalšie obdobie.

V rámci riešenia projektu boli vyrobené rôzne sendvičové štruktúry grafén/supravodivá tenká vrstva MoN. Na ÚEF SAV pomocou nízkoteplotných STM meraní na grafénovej vrstve sme pozorovali indukovanú supravodivosť.

Na štúdium indukovanej supravodivosti vo voľne visiacom (nepodopretom) graféne sme na tenkých filmoch MoN pripravili nanoštruktúry pomocou FIB na ÚMV SAV, ktoré boli následne pokryté CVD grafénom na MFA v Budapešti. Optické merania týchto nanoštruktúr realizované v Budapešti poukázali na nestabilitu týchto systémov. Grafénová vrstva vykazovala siné vráskovanie v oblasti nanoštruktúr, čo znemožnilo STM štúdium týchto nanoštruktúr.

V rámci riešenia projektu sme začali v spolupráci s kolegami z MFA v Budapešti budovať v Košiciach nové experimentálne zariadenie na prácu s monovrstvami a 2D štruktúrami.

Cieľom riešeného projektu je príprava vlákien rekombinantného pavúčieho proteínu eADF4(C16) a ich modifikácia s DNA, umožňujúca „programovateľné“ usporiadanie vlákien vďaka komplementarite DNA.

V rámci prvého roka sme sa venovali detailnému štúdiu experimentálnych podmienok, ktoré vedú k tvorbe amyloidných štruktúr (fibríl) rekombinantného pavúčieho proteínu. Študovali sme vplyv pH, ale aj teploty a prítomnosti rôznych solí na kinetiku samozbáľovania proteínu eADF4(C16) a výslednú morfológiu vytvorených štruktúr. Získané výsledky nám umožnili nastaviť experimentálne

podmienky vedúce ku kontrolovateľnej a reprodukovateľnej tvorbe amyloidných fibrilárnych vlákien rekombinantného pavúčieho proteínu. Na základe týchto výsledkov sme uskutočnili prvotné experimenty samo-zbaliťovania rekombinantného pavúčieho proteínu s naviazanými molekulami DNA (biokonjugáty). Tieto DNA-proteínové hybridy využívajúce nukleové kyseliny, sa zbaliťujú s vysokou presnosťou a predvídateľnosťou, ako napr. pri DNA origami. Na druhej strane, rekombinantné pavúčie proteíny vytvárajú nanofibrily s vysokou chemickou stabilitou, ako aj mechanickou pevnosťou. Preto je v našom záujme využitie týchto poznatkov v ďalšom roku riešenia projektu pri konštruovaní hybridných DNA-proteín konjugátov.

Výsledky experimentov na spoluriešiteľských pracoviskách ukázali, že nanočastice na báze kobaltu s core/shell morfológiou vykazujú po vhodnom tepelnom spracovaní výrazný „exchange bias efekt“, ktorý sa prejavuje výrazným posunom stredu hysterézných slučiek na x-ovej osi oproti nulovej hodnote magnetického poľa ak boli vzorky chladené na teplotu 5 K v externom magnetickom poli. Experimentálne merania boli podporené teoretickými Monte-Carlo simuláciami.

Projekt sa venuje vývoju a príprave nových nanokompozitov určených pre liečbu chorôb po akútnom ožiarení. Pozornosť sa zameriava na kombinované použitie neobalených nanočastíc oxidu céria a najnovšieho vysokoaktívneho uhlíkového enterosorbentu určeného na perorálne užitie.

V rámci riešenia úloh projektu sme sa venovali detailnému štúdiu vplyvu podmienok syntézy nanočastíc CeO₂ NPs na ich fyzikálno-chemické vlastnosti a bioaktivitu. Kontrolovanou syntézou v závislosti od obsahu izopropanolu v reakčnom médiu bola pripravená séria piatich CeO₂ nanočastíc, u ktorých bola pozorovaná korelácia medzi veľkosťou a percentuálnym podielom Ce³⁺ iónov na povrchu [1]. Detailným štúdiom sme zistili, že veľkosť častíc a ich redox vlastnosti významne vplyvajú aj na ich anti-amyloidnú a anti-oxidačnú aktivitu. Význam a dôležitosť výberu experimentálnych podmienok určujúcich výsledne fyzikálno-chemické vlastnosti sme potvrdili aj pri syntéze CeO₂ nanočastíc vo vodno-alkoholovom prostredí s kontrolovaným pH (=9) [2]. CeO₂ NP teda vykazujú veľký potenciál pre štúdium súhry medzi oxidačným stresom a chorobami súvisiacimi s prítomnosťou amyloidných štruktúr a dokázať alebo vyvrátiť hypotézu, že oxidačný stres môže hrať úlohu pri modulácii proteínov a následnej amyloidogéze [1,2]. Anti-amyloidný potenciál a perspektívu terapeutického využitia vykazujú aj fullerény. Kombináciou experimentálnych a in silico metód sme ukázali, že väzba molekúl fullerénu C₆₀ dokáže stabilizovať štruktúru proteínu a tým zabráni jeho transformácii a inhibuje tvorbu amyloidných štruktúr/vlákién [3]. Je tiež známe, že Je dobre známe, že formovanie amyloidných vlákién a ich výsledná morfológia výrazne závisia od vonkajších podmienok. V rámci riešenia úloh čiastkových úloh projektu sme monitorovali vplyv detergentu na báze cholesterolu (chobimalt) na amyloidogézu inzulínu. Zistili sme, že chobimalt výrazne ovplyvňuje nielen kinetiku agregácie inzulínu, ale aj výslednú morfológiu fibríl, a to v dôsledku postupného obsadzovania väzobných miest na proteíne [4].

Významným aspektom pri použití nanočasticových systémov je aj ich odozva na externé elektrické a magnetické pole. Aplikácia vonkajšieho elektrického poľa môže viesť k usporiadaniu magnetických nanočastíc dispergovaných v nepolárnom prostredí. Na druhej strane, výsledné usporiadanie častíc vplyvom elektrického poľa môže mať vplyv na ich odozvu na vloženie magnetického pole. Preto sme testovali schopnosť ovládať magnetickú susceptibilitu magnetických kvapalín elektrickými silami [5-11]. Ukázali sme tiež, že aplikácia striedavého a/alebo rotujúceho magnetického poľa vedie k tvorbe tepla v procesoch hypertermie [6-8]. Ukázali sme, že individuálne nanočastice disponujú silnejšou odozvou na rotujúce magnetické pole v porovnaní s nanočasticami usporiadanými v retiazkach (magnetozómy) [6,7]. Navyše, nanočasticami je možné modifikovať rôzne systémy, vrátane nanotextílií [7].

Projekt je súčasťou dlhodobej aktivity našej skupiny na experimente ATLAS v CERNe, takže všetky práce a výsledky nadväzujú na výsledky predchádzajúcich rokov, a predpokladajú pokračovanie prác v nasledujúcich rokoch. Z metodologického hľadiska sme sprevádzkovali softvér LAr detektora pre prácu v mnohovláknovom prostredí na začiatku Run-3. Softvér bol preverený v produkcii, s minimom viditeľných chýb, ktoré boli promptne odstránené počas nábehu detektora ATLAS. Pripravili a otestovali sme kalibračné konštanty pre rekonštrukciu LAr dát nameraných na začiatku Run-3. Zabezpečili sme bezporuchovú prevádzku grid farmy a jej dostupnosť v priebehu roka na úrovni 94,4 percenta, dosiahli sme požadovanú efektivitu prenosov dát a vysokú efektivitu využitia CPU. Okrem toho sme zavřili publikáciou práce na použití simulácií a dát z testov HEC kalorimetra na validáciu simulačného softvéru GEANT4 [1].

Vo fyzikálnej analýze bola obhájená PhD práca na tému spinových charakteristík top kvarkov v dileptónovom kanáli pri energii 13 TeV.

Naše metodologické práce na kalorimetrii umožnili excelentné výsledky vo fyzike Higgsovho bozónu, ktoré boli zhrnuté v článku v Nature [2].

Bohužiaľ politická situácia (vojna na Ukraine) priniesla neželaný efekt aj do publikačnej činnosti kolaborácie, ktorá pozastavila publikovanie článkov, kým sa nevzjasní situácia s autormi z Ruskej

federácie a Bieloruska, takže tento rok boli publikované iba články, dokončené pred vypuknutím vojny, z nich uvádzame niekoľko, kde mala naša skupina významnejší vklad [3-6].

Dosiahnuté výsledky:

Cieľom projektu bolo vyvinúť multifunkčné magnetické nanočastice s perspektívou ich použitia v diagnostike a v liečbe nádorových ochorení. Vďaka intenzívnej medzinárodnej spolupráci výskumníkov sa tieto ciele podarilo naplniť. Súhrn najhodnotnejších výsledkov bol publikovaný v práci [1], ktorá bola uverejnená v roku 2022 v časopise International Journal of Pharmaceutics. Práca sa venuje syntéze, fyzikálno-chemickej charakterizácii magnetických nanočastíc značených dvoma typmi radionuklidov, a popisuje výsledky získané z in vitro a in vivo testov. Vzorka modifikovaná poly-L-lyzínom (PLL) s najlepšou stabilitou, najvyšším SAR koeficientom, výtlačkom a rádiochemickou čistotou (^{177}Lu -PLL-MNČ, 80°C) bola intravenózne podaná zdravým laborátnym potkanom Wistar a biodistribúcia tohto komplexu bola zaznamenávaná v

jednotlivých orgánoch a tkanivách potkana v rôznych časoch. Dosiahnuté výsledky získané vďaka medzinárodnej spolupráci viacerých partnerov dávajú pozitívny signál na zlepšenie liečby rakoviny na báze hypertermie v kombinácii s rádioterapiou.

Projekt sa venuje využitiu dvojakej povahy kovových nanočastíc (NPs) v komplexe s amyloidnými fibrilami globulárnych proteínov pre aplikácie v nanomedicíne (terapia amyloidózy) a chemickom inžinierstve (hybridné nanomateriály pre vylepšenie katalytickej aktivity NPs). V prvom roku riešenia projektu sme systematicky študovali tvorbu amyloidných fibríl alfa-laktalbumínu s kontrolovanými vlastnosťami v prítomnosti rôznych solí. Zistili sme, že prítomnosť rôznych kationov ovplyvňuje nielen kinetiku tvorby fibríl alfa-laktalbumínu, ale aj štruktúrne a morfológické vlastnosti. Pozorovaný efekt závisí od veľkosti kationu a hydratačného obalu.

V priebehu rokov 2020, 2021 a 2022 boli kolegami z Institute for Energy Technology (IFE), Kjeller, Nórsko, a kolegami z Lithuanian Energy Institute (LEI), Kaunas, Litva, navrhnuté a pripravené viaceré vzorky (tenké vrstvy) rôznych oxy-hydridov (YHO, GdHO, TiHO), ktoré mali rôzne zloženie a rôznu hrúbku. Žiaľ, všetky experimentálne študované vzorky vykazovali polovodičový charakter vodivosti (ich elektrický odpor so znižovaním teploty rástol) a neboli supravodivé. Príčinou toho bola s najväčšou pravdepodobnosťou skutočnosť, že v oxy-hydridoch prítomné atómy kyslíka výrazne redukujú hustotu vodivostných elektrónov, čo neumožňuje vytvorenie podmienok pre vznik supravodivého stavu.

V roku 2022 boli ukončené a analyzované viaceré experimenty v súlade s projektovými zámermi. Tieto výsledky boli následne prezentované formou viacerých karentovaných publikácií a kapitoly v knihe, ako aj na medzinárodných vedeckých konferenciách. Spomenúť možno predovšetkým konferenciu „13th International Conference on the Scientific and Clinical Applications of Magnetic Carriers“ v Londýne (14.-17. jún 2022), kde mimo prezentovania našej práce sme boli účastní množstva kvalitných vedeckých diskusií prínosných pri riešení projektu.

V práci [1] bol analyzovaný ohrievací efekt magnetitových nanočastíc rôznych konfigurácií dvoma prístupmi. Na ich ohrev sa použilo striedavé magnetické pole, resp. rotujúce magnetické pole. Následne sa sledovala odozva častíc vo forme stabilného koloidu individuálnych častíc (magnetická kvapalina), vo forme reťazcov/filamentov (magnetožomov), ako aj mix koloidných systémov magnetickej kvapaliny a magnetožomov. Ukázalo sa, že spôsob generovania magnetického poľa, ako aj usporiadanie magnetických častíc vo vzorke (individuálne vs filamenty vs ich mix) významne vplývajú na parametre magnetickej hypertermie akými sú ohrievacia rýchlosť, či špecifická rýchlosť absorpcie (SAR). Analýzou ohrievacej schopnosti rôznych typov magnetických štruktúr v podmienkach aplikovaného striedavého resp. rotujúceho magnetického poľa sme sa venovali aj v prácach [2, 3]. V štúdiu [2] sme analyzovali magneticky modifikovanú bakteriálnu celulózu (BC).

Štruktúry BC sú tvorené extracelulárne vylučovanými nanovláknami produkovanými počas vhodného kultivačného procesu rôznymi druhmi baktérií, vrátane gramnegatívnych baktérií *Acetobacter*, *Azotobacter*, *Rhizobium*, *Agrobacterium*, *Pseudomonas*, *Salmonella* alebo *Alcaligenes*, ako aj grampozitívnych baktérií *Sarcina ventriculi*. Priemer nanovláknien je asi 100 nm a tvoria koherentnú 3D sieť. Magneticky modifikovaná BC má jedinečné chemické, fyzikálne a biologické vlastnosti. Takýto biopolymér má veľký potenciál pre vývoj nových biomateriálov pre medicínske aplikácie. V rámci problematiky „bio-filamentov“ (konkrétne magnetozómov) bol publikovaný aj prehľadový článok [4] s názvom „Magnetotactic Bacteria: From Evolution to Biomineralization and Biomedical Applications“, ktorý poskytuje mnohé prehľadové informácie pre širokú verejnosť v danej oblasti. Taktiež sme pokračovali v štúdiu problematiky kvapalných kryštálov dopovaných magnetickými nanočasticami. Magnetická modifikácia umožňuje orientovať molekuly kvapalného kryštálu mimo elektrického aj magnetickým poľom. V práci [5] bol skúmaný kombinovaný účinok koncentrácie nanočastíc a hrúbky meracej cely na dielektrické a elektrické vlastnosti homeotropicky usporiadaných nematických kvapalných kryštálov. Novou skúmanou oblasťou / materiálom vo vývoji nových magnetických filamentov sú Pickeringové emulzie na báze rôznych typov magnetických systémov. Plánujeme modifikovať kvapky (droplety) vysokoviskózných tekutín magnetickými materiálmi rôznych parametrov (magneticky upravený halloysit, magnetozómy a iné). Prvotné experimenty na Pickeringových emulziách na báze dropletov ricínového oleja stabilizovaných magnetitovými nanočasticami boli vykonané v práci [6], pričom boli skúmaný ich ohrievací efekt v podmienkach rotujúceho magnetického poľa. Z publikovaných prác možno ešte spomenúť kapitolu v knihe [7]: „Dielectric and Magnetic Properties of Nanofluids“ vo vydavateľstve „The Royal Society of Chemistry“, kde sa okrem iného venuje aj pozornosť štrukturalizačným procesom magnetických častíc, ktoré pod vplyvom elektrického poľa, vytvárajú ihlicovité útvary v modelovom kondenzátore.

Dosiahnuté výsledky:

Anti-koincidenčný detektorový modulu ACM je súčasťou vedeckého komplexu PEP, ktorý je inštalovaný na palube sondy JUICE a dlhodobo testovaný v rámci sondy JUICE ako celku. Vzhľadom na oneskorenie misie kvôli Covid pandémie (štart mal byť v máji 2022) bola sonda koncom roka 2022 ešte finalizovaná a testovaná v termovákovej komore v Toulouse Space Centre, Francúzsko. ACM absolvoval všetky testy bez akýchkoľvek anomálií. Štart sondy JUICE je t.č. plánovaný na 14.4.2023. Pre testovanie a charakterizáciu systému PEP (aj počas letovej fázy JUICE) je vo vývoji systém RATEX-J-Lab (RADIATION TEST EXperiment for JUICE). Bola dokončená elektronická doska digitálnej časti systému. Front-end doska pre dva polovodičové detektory SSD, jednu mikrokanaľkovú dosku MCP a kanálový elektrónový násobič CEM je vo fáze re-dizajnu kvôli novým skutočnostiam zisteným počas vývoja ACM detektora.

Riešením úloh projektu zameraných na štúdium účinku nano/mikročastíc na amyloidnú agregáciu proteínov (zeolity, nanočastice (NP) na báze Fe_3O_4 a CeO_2 NPs) a na dizajn a testovanie magnetických nanočasticových systémov na cieleň transport liečiv sme ukázali:

i) Deštrukčný efekt feritínových derivátov, rekonštruovaného feritínu a magnetoferitínu na amyloidné fibrily lysozýmu. Kombináciou viacerých metód a techník sme odhalili. Že schopnosť rozrušiť amyloidné štruktúry je podmienené prítomnosťou železa. Na druhej strane však, interakcia feritínových derivátov s lysozýmovými amyloidnými fibrilami vedie k uvoľňovaniu potenciálne nebezpečných železnatých iónov. Javí sa teda, že pripravené deriváty feritínu, rekonštruovaný feritín (RF) a magnetoferitín (MF) disponujú dvojakým účinkom: a) terapeutickým, antiamyloidným so schopnosťou rozrušiť amyloidné fibrily; a b) nepriaznivým, ktorý môže viesť k oxidačnému stresu v dôsledku uvoľňovania Fe^{2+} iónov. Tieto aspekty však môžu významne prispieť v dizajne nových biomedicínskych aplikácií [1].

ii) Perspektívu použitia ultrazvukovej transmisnej tomografie (UTT) v teranostike. Preukázali sme, že systémy dopované magnetickými nanočasticami slúžiacimi ako mediátory, vykazujú značné zlepšenie kontrastu pri UTT. Nanočasticami dopované systémy v procese ultrazvukového ohrevu generujú teplo a pozorujeme indukované zvýšenie teploty, čo predstavuje sľubný teranostický prístup [2]. Tvorbu tepla v systémoch obsahujúcich nanočastice sme pozorovali po aplikovaní vonkajšieho magnetického poľa na tzv. Pickeringové emulzie, kde nanočastice pôsobia ako stabilizátory [3].

iii) Využitie magnetooptickej aktivity kompozitných systémov obsahujúcich magnetické nanočastice. Aplikácia vonkajšieho magnetického poľa na systémy obsahujúce magnetické častice sa prejaví aktivitou známou ako Faradayov a Cotton-Moutonov efekt, kedy dochádza napr. k stočeniu roviny polarizácie vzorkou prechádzajúceho polarizovaného svetla. To umožňuje určiť hodnotu magnetického poľa. Teoretickými výpočtami bol navrhnutý systém mapovania magnetického poľa, čo je potrebné s ohľadom na biomedicínske aplikácie systémov obsahujúcich magnetické častice, ako napr. cieleň transport liečiv, magnetické zobrazovacie techniky, hypertermia [4,5].

Jedným z najatraktívnejších moderných farmaceutických prístupov je použitie multifunkčných materiálov. V rámci projektu sa zameriavame hlavne na využitie zeolitov na báze klinoptilolitu (CZ). Mezoporézná štruktúra klinoptilolitu umožňuje absorbovať rôzne typy látok, vrátane nanočastíc a teda, CZ-kompozity môžu byť použité ako sľubné biokompatibilné nosiče pre cielené podávanie liečiva s riadeným uvoľňovaním. Multifunkčné CZ kompozity boli pripravené inkorporovaním fluorescenčných farbív, Al-ftalocyanínu, Zn-porfínu a hypericínu do pórov klinoptilolitu. Skúmali sme a porovnávali vplyv fluorescenčných látok samostatne a aj vo forme kompozitov CZ na amyloidogénu inzulínu, biokompatibilitu, bunkovú metabolickú aktivitu a fluorescenčnú farmakokinetiku. Druhou študovanou skupinou častíc s potvrdenou anti-amyloidnou aktivitou boli nanočastice oxidu cerititého (CeO_2) a magnetické, magnetitové častice (Fe_3O_4) tvoriace jadro magnetoferitínu a jeho derivátov [1,2]. Okrem toho, javí sa, že v procesoch amyloidnej agregácie majú významnú úlohu hydrofóbne interakcie amyloidogénnych proteínov s membránami, resp. s jednotlivými zložkami bunkových membrán. Na druhej strane, práve fosfolipidy a detergenty sú často používané na povrchovú modifikáciu nanočastíc za účelom zabezpečenia ich biocompatibility. Monitorovaním vplyvu detergent obsahujúceho cholesterol (chobimalt) sme zistili, že dokáže signifikantne ovplyvniť nielen časový priebeh, ale aj výslednú morfológiu amyloidných fibríl v závislosti od koncentračného pomeru proteín:chobimalt [3]. Terapeutický potenciál multikompozitov obsahujúcich magnetické častice, fotoaktívne látky je možné riadiť a kontrolovať, obzvlášť pri ko-aplikácii externého žiarenia, resp. magnetického poľa, ultrazvuku a podobne. Ukázali sme, že aplikácia striedavého a/alebo rotujúceho magnetického poľa vedie k tvorbe tepla v procesoch hypertermie [4-6]. Ukázali sme, že individuálne nanočastice disponujú silnejšou odozvou na rotujúce magnetické pole v porovnaní s nanočasticami usporiadanými v retiazkach (magnetozómy) [3,4]. Navyše, nanočasticami je možné modifikovať rôzne systémy, vrátane nanotextílií [4]. Magnetické nanočastice usporiadané na povrchu kvapiek vytvárajú tzv. Pickeringé emulzie a pôsobia ako stabilizátory. Vďaka odozve na vonkajšie magnetické pole sa navyše stávajú zdrojom tepla [5].

36.) Stabilita a agregácia globulárnych proteínov v prítomnosti biokompatibilných iónových kvapalín (*Stability and aggregation of globular proteins in the presence of biocompatible ionic liquids*)

Dosiahnuté výsledky:

Pokračovali sme v štúdiu vplyvu biokompatibilných iónových kvapalín na báze aminokyselín na stabilitu a amyloidnú agregáciu globulárnych proteínov s cieľom identifikovať modulátory procesov amyloidnej agregácie a morfológie amyloidných fibríl. Zistili sme, že urýchľujúci resp. inhibičný efekt IK na kinetiku amyloidnej agregácie inzulínu závisí nielen od hydrofobicity a polarizácie aniónov a kationov ale aj od špecifických interakcií IK-proteín resp. samotných zložiek IK. Z analýzy AFM obrázkov sme zistili, že jednotlivé IK indukovali tvorbu morfológicky odlišných fibríl [1]. Zaviedli sme novú metódu a pripravili protokoly priameho merania kinetiky agregácie lysozýmu pomocou priamej detekcie fluorescence tioxalínu v platničkovj čítačke. Táto technika má vyššiu presnosť, citlivosť a nízku spotrebu materiálu.

Naše výsledky ukazujú, že IK na báze aminokyselín sú schopné modulovať amyloidnú agregáciu a

morfológiu fibríl študovaných proteínov v závislosti od chemicko-fyzikálnych vlastností IK, čo môže byť prospešné pri využívaní amyloidných agregátov ako nanomateriálov. Okrem toho môže práca prispieť k lepšiemu pochopeniu všeobecného mechanizmu amyloidnej agregácie.

Dosiahnuté výsledky:

V roku 2022 bol urobený ďalší pokus pripraviť tenké vrstvy YB6 - tretou metódou - pomocou pulzného nanášania laserom (pulsed laser deposition). Aj touto metódou získané tenké vrstvy však mali polovodičový priebeh odporu v závislosti na teplote (ich el. odpor s klesajúcou teplotou rástol) a nevykazovali supravodivosť.

Keďže problematika prípravy tenkých vrstiev YB6 neviedla k želanému výsledkom, pokračovali sme s kolegami s Leobenu na už v minulom roku započatom štúdiu supravodivosti tenkých vrstiev vysoko-entropických zliatin (VEZ), ktoré v Leobene vedia v rôznych zloženiach a hrúbkach pripraviť.

Zhotovené a študované tenké vrstvy VEZ vykazovali hrúbkovo závislú supravodivosť, a ukázalo sa, že aj vplyv vysokého tlaku na ich supravodivé vlastnosti závisí na hrúbke vrstvy. V roku 2022 boli tiež domerané mikro-kontaktové spektrá týchto vrstiev, vyhodnotené všetky dosiahnuté výsledky a bola pripravená spoločná publikácia. Publikácia bola zaslaná do prestížneho fyzikálneho časopisu Physical Review B. Zaslaná publikácia bola už medzitým prijatá:

Pokračoval výskum vzťahov medzi magnetickým poľom slnečného vetra, bleskovou aktivitou (dáta z WWLLN) a sekundárnym kozmickým žiarením meraným na Lomnickom štíte (LŠ), s využitím dlhších časových radov. Pre kozmické žiarenie sa použili len dáta z neutrónového monitora na LŠ, pre blesky z európskej detekčnej siete EUCLID, ktorá poskytuje aj údaje o typoch bleskov.

V štádiu prípravy je článok o možnom vplyve slnečnej aktivity na atmosférické elektrické polia a vzrasty sekundárneho kozmického žiarenia počas búrkovej činnosti.

Hlavným výsledkom je zverejnenie a spustenie do ostrej prevádzky systému COR, na výpočet trajektórií kozmického žiarenia v magnetosfére Zeme (na adrese <https://cor.crmodels.org/>, a zdrojového kódu na GitHube na adrese https://github.com/COR-Cut-off-rigidity/Trajectories_IGRF_T04_C) a publikácia článku o COR systéme v časopise Advances in Space Research [1], ktorý je tradičným miestom publikácií o téme trajektórií kozmického žiarenia v magnetosfére Zeme. COR systém je jedným z mála dostupných systémov/nástrojov zameraných na výpočet trajektórií kozmického žiarenia v magnetosfére Zeme. Dalším bol článok v ktorom sme podrobne analyzovali chybu SDE metódy na výpočet modulácie kozmického žiarenia v heliosfére [2]. Ďalšie témy rozvíjané pri riešení projektu boli príspevky zamerané na simuláciu interakcie kozmického žiarenia s ľudským okom [3] a difúznemu koeficientu kozmického žiarenia v heliosfére [4].

Navrhli sme dva nové modely (komplexný spinovo-elektrónový model a efektívny Coupled double-Ising model) pre popis magnetizačných vlastností a termodynamiky tetraboridov vzácnych zemín (RB₄), ktoré na rozdiel od predchádzajúcich modelov zohľadňujú rôzne veľkosti spinov v spinovom a elektrónovom podsysteme, hubbardovskú interakciu a interakciu medzi týmito podsystemami. Naše numerické simulácie ukázali, že kombinácia týchto faktorov má veľký potenciál objasniť viaceré z fyzikálne zaujímavých javov pozorovaných v RB₄, ako napríklad formovanie jedinej 1/2 zdrže v magnetizačných krivkách T_mB₄ a ErB₄ alebo výrazný magnetokalorický efekt. Tieto modely navyše predpovedali v teplotnej závislosti špecifickej tepelnej kapacity jeden vrchol odpovedajúci spinovému podsystemu, ktorý korešponduje s meraniami v T_mB₄ a ErB₄, a ďalší

elektrónový vrchol objavujúci sa pri niekoľko násobne nižších teplotách.

Študovali sme vplyv iónových kvapalín (IK) obsahujúcich imidazolový kation a anióny tvorené nabitými a nepolárnymi aminokyselinovým zvyškami na tvorbu amyloidných fibríl inzulínu. Pomocou metódy metódy viazania Tioflavínu T sme zistili, že kinetiku amyloidnej agregácie inzulínu je možné inhibovať alebo urýchliť v závislosti od polarít amino-kyselinového aniónu. V prítomnosti amino-kyselinových aniónov s prídavným nábojom (Lyz a Glu) ako aj slabo polárneho Gly dochádzalo ku skráteniu polčasu a lag-fázy kinetiky agregácie v porovnaní s podmienkami bez prítomnosti IK. Nepolárne anióny (Val, Leu) naopak predlžovali polčas a lag-fázu agregácie, pričom v prítomnosti Ile došlo k úplnej inhibícii tvorby fibríl v sledovanom časovom intervale. Vzniknuté fibrily boli vizualizované a morfológicky charakterizované pomocou AFM mikroskopie. Získané výsledky prispievajú k lepšiemu pochopeniu mechanizmov amyloidnej agregácie ako aj procesov zodpovedných za tvorbu morfológicky definovaných fibríl s potenciálom využitia v biotechnológii.

V rámci projektu sme sa zamerali na objasnenie mechanizmu tvorby fibríl globulárnych proteínov (alfa-laktalbumínu a lyzozýmu) v prítomnosti rôznych solí (1, 5) a iónových kvapalín (IL) (3, 6). V prípade alfa-laktalbumínu sme sledovali tvorbu amyloidných fibríl v prítomnosti chloridových solí katiónov. Zistili sme, že koncentrácia solí, hydratačný obal katiónov a ich veľkosť výrazne ovplyvňuje štruktúru natívneho proteínu, pričom tieto zmeny v štruktúre následne ovplyvnili aj kinetiku tvorby fibríl (1, 5). Ďalšia práca bola zameraná na štúdium vplyvu IL na báze 1-etyl-3-metylimidazolia s kozmotropným acetátom (EMIM-ac) a chaotropným tetrafluórborátom (EMIM-BF₄) na kinetiku agregácie a morfológie lyzozýmových amyloidných fibríl. V tejto práci sme využili atómovú silovú mikroskopiu (AFM) so štatistickou analýzou obrazu pre podrobnú morfológickú analýzu (2). Zistili sme, že oba IL znižujú tepelnú stabilitu lyzozýmu a významne urýchľujú fibrilizáciu v závislosti od koncentrácie IL. Obe IL indukovali tvorbu amyloidných fibríl s typickou vláknitou morfológiou, pre EMIM-BF₄ bola identifikovaná vyššia morfológická variabilita fibríl, ktoré pozostávali z iného počtu prepletených protofilamentov (3, 6). Zároveň sme sa venovali aj sledovaniu inhibičného potenciálu rôznych typov malých molekúl na amyloidnú agregáciu proteínov. Zistili sme, že extrakty rôznych čínskych bylín a čaju majú výrazný inhibičný potenciál na tvorbu fibríl lyzozýmu a Abeta peptidu (4). Testovali sme aj aktivitu magnetických nanočastíc ako potenciálnych inhibítorov amyloidnej agregácie proteínov (7). Naše výsledky ukázali, že ich anti-amyloidný účinok závisí od ich štruktúry, veľkosti a typu proteínu.

V rámci spolupráce so zahraničným pracoviskom Institute of Nuclear Sciences "Vinca", University of Belgrade, Belehrad, Srbsko sme náš výskum v rámci projektu rozšírili o prípravu novej série MNPs značených rádionuklidmi, ktorá predstavuje podstatný prínos pre výskum duálnej terapie, ktorá zahŕňa simultánny účinok rádiofarmák a magnetickej hypertermie pri liečbe nádorových ochorení. Kľúčovou úlohou v práci [1] bola príprava, optimalizácia a charakterizácia MNPs funkcionizovaných prolínom, tryptofánom a poly-L-lyzínom s cieľom študovať ich schopnosť účinne viazať rádionuklidy a zároveň generovať teplo pri aplikácii striedavého magnetického poľa pre ich možnú aplikáciu v rádiodiagnostike, rádioterapii a magnetickej hypertermii. Na týchto vzorkách bolo prevedené rádioaktívne značenie viacerými metódami a bola porovnaná účinnosť naviazania, stabilita a rádiochemická čistota. Najlepší výsledok bol dosiahnutý na vzorke pozostávajúcej z poly-L-lyzínom funkcionizovaných MNPs s konjugovaným radionuklidom ¹⁷⁷Lu. Vzorka mala nielen najvyššiu rádiochemickú čistotu 99 %, ale vykazovala aj vysokú in vitro a in vivo stabilitu. Navyše vzorka mala aj najvyšší SAR koeficient [1].

Neutrónová prášková difrakcia odhalila, že DyFeO₃ je prvý ortoferit, ktorý má nesúmerateľné magnetické usporiadanie podmriežky vzácnej zeminy, čo je dôležitá informácia zanedbaná v diskusii

o jeho multiferoických vlastnostiach. Magnetokryštalická anizotropia $\text{TbMn}_{0.98}\text{Fe}_{0.02}\text{O}_3$ monokryštálu je obrovská a dopovanie železom posúva magnetické prechody k nižším teplotám. Proces otočenia znamienka magnetizácie je prirodzenou vlastnosťou monokryštálu $\text{NdMn}_{0.8}\text{Fe}_{0.2}\text{O}_3$. Tento jav je veľmi anizotropný. Model dvoch Nd a Mn vzájomne prenikajúcich sa magnetických podmriežok opisuje otočenie znamienka magnetizácie lepšie ako klastrový model. Experimentálna štúdia magnetokalorického javu nanočastíc $\text{La}_{0.70}\text{Ag}_{0.25}\text{MnO}_3$ s rôznym obsahom kyslíka odhalila, že adiabatická zmena teploty, zmena magnetickej entropie a relatívna chladiaca sila sú maximálne pre vzorku s najnižším obsahom kyslíka a klesajú so zvyšujúcim sa obsahom kyslíka. Oxidačný stres, vznikajúci v dôsledku porušenia rovnováhy medzi prooxidačnými a antioxidačnými reakciami v živých organizmoch, je jedným z možných mechanizmov, ktorý zvyšuje poškodenie kľúčových bunkových zložiek, proteínov, DNA, ale aj bunkových membrán je oxidačný stres. V rámci riešenia úloh projektu sme našu pozornosť sústredili na nanočastice CeO_2 , ktoré vďaka nízkemu redox potenciálu disponujú pseudoenzymatickou antioxidačnou aktivitou a teda, dokážu efektívne ovplyvňovať oxidačný stres. Venovali sme sa detailnému štúdiu vplyvu podmienok syntézy nanočastíc CeO_2 NPs na ich fyzikálno-chemické vlastnosti a bioaktivitu. Ukázali sme, že úpravou reakčných podmienok počas syntézy je možno kontrolovať výsledné fyzikálno-chemické vlastnosti vytvorených nanočastíc. Pozorovaná bola korelácia medzi veľkosťou a percentuálnym podielom Ce^{3+} iónov na povrchu vytvorených nanočastíc [1,2]. Detailným štúdiom sme zistili, že veľkosť častíc a ich redox vlastnosti významne vplyvajú aj na ich anti-amyloidnú a anti-oxidačnú aktivitu. Význam a dôležitosť výberu experimentálnych podmienok určujúcich výsledne fyzikálno-chemické vlastnosti sme potvrdili aj pri syntéze CeO_2 nanočastíc vo vodno-alkoholovom prostredí s kontrolovaným pH (≈ 9) [2]. Inhibičný, anti-amyloidný efekt bol pozorovaný aj v prítomnosti fullerénu C_{60} . Pomocou in silico metód a experimentálnych údajov sme ukázali ako prítomnosť C_{60} ovplyvňuje štruktúru a stabilitu natívneho proteínu a následne aj amyloidnú agregáciu [3]. Je dôležité poznamenať, že modifikácia bio-makromolekúl vyvolaná oxidačným stresom významne ovplyvňuje ich špecifické interakcie s prirodzenými väzobnými partnermi, ako sú „proteín-proteín“ alebo „proteín-fosfolipid“ interakcie. Dôležité postavenie má práve cholesterol, ktorý má kľúčovú úlohu v štruktúrálnej a funkčnej integrite bunkových membrán; a interakcia cholesterolu s proteínmi vrátane amyloidogénnych, môže zmeniť ich stabilitu a funkciu. Ukázali sme, že v závislosti od pomeru koncentrácie proteín:chobimalt, pozorujeme značné ovplyvnený časový priebeh formovania amyloidných vlákien, ale aj ich výslednú morfológiu [4].

V roku 2022 dominovali patentové aktivity. Bol nám udelený patent Úradom priemyselného vlastníctva SR týkajúci sa spôsobu čistenia organických vodorozpustných látok od hydrofóbných kontaminantov [1]. Metóda je založená na tom, že sa kontaminanty (malé molekuly hydrofóbných nízkomolekulárnych látok) odstraňujú na princípe nanosegregácie v ternárnej zmesi bez nutnosti pridania stabilizátorov ktoré by predstavovali sekundárnu kontamináciu a následnej nanofiltrácie využívajúcej vlastnosti segregovaných nanočastíc a nanokvapiiek (mechanická pevnosť a tvarová i časová stabilita). Ďalej sme v priebehu roku 2022 podali prihlášku na Európsky patentový úrad týkajúcu sa problematiky využitia javov nanosegregácie na purifikáciu vodorozpustných polymérov do vysokých stupňov čistoty [2]. Zameranie bolo na hydrofóbné kontaminanty. Táto problematika je aplikácie zaujímavá z toho hľadiska, že vodorozpustné polyméry sa štandardne prečisťujú metódami ako je dialýza a rôzne varianty ultrafiltrácie, predovšetkým filtrácia na báze tangenciálneho toku. Vo všetkých týchto prípadoch sa kontaminanty (malé molekuly nízkomolekulárnych látok) odstraňujú na princípe prechodu cez membránu s pórmí dostatočne veľkými na prechod kontaminantov a dostatočne malými na to aby zabránili prechodu polymérov. V každom prípade, kontaminanty musia byť vodorozpustné aby bolo možné ich týmto spôsobom odstrániť. Hydrofóbné kontaminanty sú teda problémom, obzvlášť keď ide o čistenie do vysokých stupňov čistoty pre náročnejšie aplikácie,

predovšetkým biomedicínske.

21.) Štúdium a modifikácia vlastností pavúčieho proteínu nadprodukovaného v *Escherichia coli*

Dosiahnuté výsledky:

V rámci projektu sa plánujeme zamerať na dva hlavné ciele: 1) stanoviť a zaviesť kontrolovateľné samo-usporiadanie pavúčieho proteínu prístupom „zdola nahor“; a 2) príprava nanokompozitov na báze amyloidných štruktúr pavúčieho proteínu pre biomedicínske a biotechnologické aplikácie.

Venovali sme detailnému štúdiu experimentálnych podmienok, ktoré vedú k tvorbe amyloidných štruktúr (fibríl) rekombinantného pavúčieho proteínu. Študovali sme vplyv pH, ale aj teploty a prítomnosti rôznych solí na kinetiku samozbaľovania proteínu eADF4(C16) a výslednú morfológiu vytvorených štruktúr. Získané výsledky nám umožnili nastaviť experimentálne podmienky vedúce ku kontrolovateľnej a reprodukovateľnej tvorbe amyloidných fibrilárnych vlákien rekombinantného pavúčieho proteínu. Za účelom prípravy nanokompozitov sme testovali bioaktivitu CeO₂ nanočastíc, ktoré vďaka nízkemu redox potenciálu disponujú pseudoenzymatickou aktivitou a majú schopnosť ovplyvniť aj procesy formovania amyloidných vlákien. Zistili sme, že ich bioaktivita reprezentovaná anti-amyloidnou a anti-oxidačnou aktivitou koreluje s fyzikálno-chemickými vlastnosťami (veľkosť a obsah Ce³⁺ iónov na povrchu), ktoré je možné riadiť vhodne upravenými podmienkami syntézy [1,2]. Schopnosť riadiť procesy amyloidnej agregácie bola pozorovaná aj pre cholesterol obsahujúci detergent chobimalt [3].

Dosiahnuté výsledky:

Na prípravu binárnych Fe-B a ternárnych Fe-Co-B magneticky mäkkých zliatin s vysokými hodnotami nasýtenej magnetickej indukcie sme použili nekonvenčnú techniku ultra-rýchleho tepelného spracovania využívajúcu vloženie tenkých kovových vzoriek medzi masívne medené bloky predhriate na požadovanú žihaciu teplotu. Táto žihacia metóda predstavuje významný pokrok pri príprave nanokryštalických magneticky mäkkých zliatin. Extrémne rýchle ohriatie vzorky umožnilo vytvorenie dostatočne jemnej nanokryštalickej štruktúry i pre zloženia zliatin s výrazne redukovaným obsahom sklotvorných nemagnetických prvkov čo viedlo k nárastu nasýtenej magnetickej indukcie na hodnoty 1.9 - 2 T. Naše experimenty ukázali že tieto zliatiny vykazujú veľmi dobrú teplotnú stabilitu magneticky mäkkých charakteristík v intervale teplôt 30 – 250°C. To z nich robí sľubných kandidátov pre vybrané technické aplikácie, v ktorých sú magneticky mäkké materiály vystavené zvýšeným pracovným teplotám.

V rýchlochladených kovových zliatinách typu FINEMET bol sledovaný vplyv mechanického namáhania na magnetizačné procesy. Pre túto štúdiu boli vybrané amorfné kovové pásy s nominálnym zložením Fe_{73.5}Cu₁Nb₃Si_{13.5}B₉. Pri rôznych stupňoch mechanického namáhania boli pozorované významné rozdiely v magnetických vlastnostiach amorfných pásov. Pôvod týchto efektov bol interpretovaný zmenou parametrov doménových stien (hrúbka, energia na jednotku plochy) ako i vnútorných napätí, ktoré sú prekážkami ich pohybu v procese premagnetovania. Teoretická FORC analýza bola použitá pri štúdiu magnetických vlastností súboru Ni-Fe-Ga nanodróto, vykazujúcich efekty magnetickej tvarovej pamäte. Získané výsledky poukázali na existenciu magnetostatickej väzby medzi susednými nanodrótmami, ktorá významným spôsobom ovplyvňuje magnetické charakteristiky tohto silne interagujúceho systému feromagnetických nanodróto.

Dosiahnuté výsledky:

Slzná tekutina a sliny sú netradičné biologické odberové materiály. Odber je neinvazívny, čo je výhodou v porovnaní s odberom krvi ako štandardného biologického materiálu. Neobsahujú pigmenty, ktoré interferujú pri bežných spektrofotometrických analýzach, ale obsahujú vodu, elektrolyty, proteíny, lipidy, hormóny a ďalšie látky. Charakterizácia jej zloženia pri rôznych zápalových ochoreniach so zameraním na tvorbu amyloidov viacerými metódami predstavuje nový diagnostický prístup. Zloženie slznej tekutiny a slín u pacientov sa významne mení v porovnaní so zdravými jedincami. Existujú aj doposiaľ necharakterizované interindividuálne zmeny v zložení slznej tekutiny a slín, ktoré by mohli umožniť personálnu diagnostiku a aplikáciu liečby šitej na mieru.

V rámci riešenia projektu sme využili poznatky a metodiky získané pri štúdiu amyloidnej agregácie Abeta proteínov pre štúdium fibrilizácie globulárnych proteínov v prítomnosti rôznych solí a iónových kvapalín (1, 2, 3, 5, 6, 9, 10). Zistili sme, že tvorba fibríl a ich výsledná morfológia závisí od typu kationu, hydratačnej energie a veľkosti. Naďalej sme pokračovali v identifikácii nových potenciálnych anti-amyloidných inhibítorov. Zamerali sme sa na určenie, ktorý štruktúrny motív je nositeľom ich anti-amyloidných vlastností. Chceli sme overiť, či mechanizmus anti-amyloidného účinku identifikovaný pre Abeta peptidy sa uplatňuje aj pri ich pôsobení na globulárne proteíny ako

inzulín a lyzozým (4, 7, 8, 11, 12).

Nanočastice môžu byť použité v mnohých terapeutických postupoch, vrátane riadeného dodávania a uvoľňovania liečiva, tepelnej terapie a foto- a sonodynamickej terapie. Tieto terapeutické prístupy sú však doposiaľ limitované, kvôli ťažkostiam spojeným s presnou kontrolou ich terapeutickej účinnosti a cieľenou lokalizáciou. Ako vhodný prístup sa javí aplikácia ultrazvukovej transmisnej tomografie (UTT) po ultrazvukovom ohreve s využitím nanomateriálov ako mediátorov [1]. Testované boli viaceré nanomateriály a preukázali sme výrazné zlepšenie kontrastu pri UTT po dopovaní systému nanočasticami, ktoré v procese ultrazvukového ohrevu generujú teplo a pozorujeme indukované zvýšenie teploty. Kombinácia zobrazovacej modalít založenej na všeobecne bezpečnom a dobre známom ultrazvukovom zobrazovaní a použitie nanomateriálov ako mediátorov predstavuje sľubný teranostický prístup [1]. Za účelom presnej a účinnej lokalizácie liečiva viazaného na magnetický nanočasticový systém bol zostrojený fokusovaný magnet. Experimentálne testovanie bolo uskutočnené pri intravenóznom a intraartériálnom podaní nanokapsúl potkanom, ale aj pri 3D-modeli ľudského supra-vaskulárneho systému vytlačeného na 3D tlačiarňi. Ukázali sme že pri endovaskulárnom injektovaní nanokapsúl tvorených magnetickými časticami s naviazaným liečivom, boli tieto nanokapsuly účinne dopravené a udržané v mieste určenia. Pomocou fluorescenčného farbenia sme preukázali zhruba 4-násobne vyššie zakoncentrovanie liečiva v mieste určenia pri použití magnetu. Tento prístup kontrolovaného endovaskulárneho podávania liečiv a magnetického zakoncentrovania predstavuje sľubný prístup pri liečbe stavov po ischémii/mŕtvici [2]. Významným aspektom pri použití nanočasticových systémov je aj ich odozva na externé elektrické a magnetické pole. Aplikácia vonkajšieho elektrického poľa môže viesť k usporiadaniu magnetických nanočastíc dispergovaných v nepolárnom prostredí. Na druhej strane, výsledné usporiadanie častíc vplyvom elektrického poľa môže mať vplyv na ich odozvu na vložené magnetické pole. Ukázali sme tiež, že aplikácia striedavého a/alebo rotujúceho magnetického poľa vedie k tvorbe tepla v procesoch hypertermie [3-5]. Ukázali sme, že individuálne nanočastice disponujú silnejšou odozvou na rotujúce magnetické pole v porovnaní s nanočasticami usporiadanými v retiazkach (magnetozómy) [3,4]. Navyše, nanočasticami je možné modifikovať rôzne systémy, vrátane nanotextílií [5]. Významným terapeutickým potenciálom vďaka jedinečným vlastnostiam disponujú aj nanočastice CeO₂, ktoré sú vhodným kandidátom pri štúdiu procesov vznikajúcich v dôsledku oxidačného stresu [6]. Dokážu

významne ovplyvniť amyloidogézu proteínov a vykazujú pseudoenzymatickú (antioxidačnú) aktivitu v závislosti od ich fyzikálno-chemických vlastností, ktoré je možné riadiť vhodne upravenými podmienkami syntézy [6]. Anti-amyloidný inhibičný efekt sme pozorovali aj pre fullerén C60, a pomocou in silico metód sme ukázali ako prítomnosť C60 ovplyvňuje štruktúru a stabilitu natívneho proteínu a následne aj amyloidnú agregáciu [7]. Jedným z cieľov projektu je príprava nanočasticových nosičov liečiv, kde sa ako vhodný kandidát javia Fe₃O₄ a CeO₂ nanočastice ktoré disponujú rozmanitými vlastnosťami, vrátane katalytickej aktivity, čo ich predurčuje na široké využitie v priemysle a aplikáciou v biomedicíne [6,8]. Ich praktická aplikácia však závisí od ich stability a biokompatibility. To je možné zabezpečiť vhodnou povrchovou úpravou, napr. použitím fosfolipidov a detergentov. Tieto amfifilné molekuly však dokážu výrazne ovplyvniť hydrofóbne interakcie. Ukázali sme, že chobimalt (detergent obsahujúci cholesterol) výrazne ovplyvňuje nielen kinetiku agregácie inzulínu, ale aj výslednú morfológiu fibril, a to v dôsledku postupného obsadzovania väzobných miest na proteíne [9].

Riešenie projektu NANOELLEN bolo v roku 2022 orientované na plánované testovanie nanokvapalín na báze GTL oleja v prototypu jednofázového transformátora s nominálnym výkonom 5 kVA. V tomto roku boli tiež pripravené nanokvapaliny na báze syntetických a prírodných esterov. Okrem nanokvapalín s obsahom magnetických nanočastíc boli úspešne pripravené aj nanokvapaliny s obsahom fullerénu C₆₀, ktorý výrazne zlepšil tepelný transport a elektrickú pevnosť nosných kvapalín. Na pripravených nanokvapalinách boli skúmané dielektrické, magnetické, tepelné a štruktúrne vlastnosti. Počas riešenia tohto projektu v roku 2022 vznikli nasledujúce publikácie:

Vplyv substrátu na supravodivé vlastnosti ultratenkých filmov – Na ultratenkých filmoch Mo₂N hrúbky 3nm, ktoré a nachádzali v tesnej blízkosti kritickej neusporiadanosti sme študovali lokálne supravodivé vlastnosti pomocou nízko-teplotných STM meraní. Na povrchoch študovaných vzoriek sme pozorovali nehomogénne oblasti veľkosti ~ 100 – 1000 nm². Po podrobnej analýze nameraných tunelových spektier sme zistili, že nehomogenity supravodivého stavu korelujú s nerovnosťami študovaných povrchov. Tunelové spektrá merané v oblastiach, kde je vzorka tenšia vykazujú menšiu hodnotu supravodivej energetickej medzery a väčšie spektrálne rozmazanie ako v hrubších oblastiach, t.j. supravodivosť je výraznejšie potlačená v oblastiach, ktoré sú bližšie k zafirovému

substrátu. Ukázali sme, že v ultratenkých filmoch Mo₂N rozhranie medzi tenkým filmom a substrátom je lokálnym zdrojom potlačenia supravodivosti a nárast spektrálneho rozmazania v oblastiach s menšou hodnotou energetickej medzery je zapríčinený lokálnymi depárovacími (pair-breaking) efektmi Cooperových párov. Výsledky boli vybraté na publikovanie v špeciálnom vydaní časopisu J. Supercond. Nov. Magn. [1], ktorý bol venovaný 95 narodeninám Prof. K. Müllera, nositeľa Nobelovej ceny za objav vysokoteplotnej supravodivosti.

Štúdium supravodivosti v dopovanom germánii – V spolupráci so skupinou Prof. Y. Naydjuka z FTINT Charkov sme sa venovali štúdiu supravodivosti v dopovaných germániových vzorkách. V týchto systémoch supravodivosť bola pozorovaná ešte v 60-tich rokoch minulého v prítomnosti vysokého tlaku. Supravodivosť vykazovala kovová fáza, ktorá sa nachádzala v blízkosti tlakom indukovaného prechodu izolant-kov. V našich experimentoch sme študovali túto supravodivú fázu pomocou mikrokontaktovej spektroskopie. Tlak sme vytvorili lokálne, pritlačením ostrého kovového hrotu z PtIr na povrch dopovaného germánia. Takto vytvorený kontakt sme používali na meranie I-V charakteristík pri teplotách $T > 1.5$ K. Zistili sme, väčšina mikrokontaktov bola balistická s evidentnou prítomnosťou Andreevovskej reflexie. To poukazovalo na prítomnosť supravodivého stavu v blízkosti mikrokontaktu. Fitovaním I-V charakteristík na teoretický model BTK sme určili veľkosť energetickej medzery a jej závislosť od teploty a magnetického poľa. Zistili energetickú medzeru $\Delta = 2,45$ meV s kritickou teplotou $T_c = 5,5$ K, čo svedčí o prítomnosti extrémne silnej supravodivej väzby $2\Delta/kBT_c = 10 \pm 1$ čo takmer 3 krát prevyšuje hodnotu BCS väzby v klasických supravodičoch [2].

Naše výskumné aktivity boli zamerané na štúdium nanokryštalických magneticky mäkkých zliatin s vysokými hodnotami nasýtenej magnetickej indukcie, ktoré sme pripravili využitím nekonvenčnej techniky ultra-rýchleho tepelného spracovania. Za týmto účelom sme skonštruovali žihaciu aparaturu, vďaka ktorej bolo možné realizovať ultra-rýchle tepelné spracovanie študovaných

amorfných kovových pásov vo vákuu alebo v ochrannnej atmosfére. Toto zariadenie využíva vopred predhriate masívne medené bloky, medzi ktoré sa vkladá žihamá vzorka pričom doba žihania postačujúca na nanokryštalizáciu amorfných prekursorov je zvyčajne niekoľko sekúnd. Vysoká rýchlosť ohrevu a podstatne kratšie časy tepelného spracovania v porovnaní s konvenčnými žihacími technikami umožnili dosiahnuť tvorbu nanokryštalickej štruktúry a s ňou spojené zlepšenie magnetických parametrov i v prípade binárnych Fe-B a ternárnych Fe-Co-B zliatinových systémoch. Vďaka redukovanému obsahu sklotvorných nemagnetických prvkov sme v týchto zliatinách dosiahli extrémne vysoké hodnoty nasýtenej magnetickej indukcie, ktoré dosahovali 1,9 – 2 T. Pre vzorky na báze FeCoBCu a FeSnB viedli experimenty s využitím techniky rýchleho žihania k zmenšeniu veľkosti nanokryštalických zŕn a k získaniu podstatne lepších magnetických vlastností v porovnaní so klasickým dlhodobým žihamím v konvenčnej žihacej aparátúre. V prípade rýchlochladených kovových zliatin typu FINEMET bol sledovaný vplyv mechanického namáhania na magnetizačné procesy. Pre túto štúdiu boli vybrané amorfné kovové pásy s nominálnym zložením Fe_{73.5}Cu₁Nb₃Si_{13.5}B₉. Pri rôznych stupňoch mechanického namáhania boli pozorované významné rozdiely v magnetických vlastnostiach amorfných pásov. Pôvod týchto efektov bol interpretovaný zmenou parametrov doménových stien (hrúbka, energia na jednotku plochy) ako i vnútorných napätí, ktoré sú prekážkami ich pohybu v procese premagnetovania. Teoretická FORC analýza bola použitá pri štúdiu magnetických vlastností súboru Ni-Fe-Ga nanodráotov, vykazujúcich efekty magnetickej tvarovej pamäte. Získané výsledky poukázali na existenciu magnetostatickej väzby medzi susednými nanodráotmi, ktorá významným spôsobom ovplyvňuje magnetické charakteristiky tohto silne interagujúceho systému feromagnetických nanodráotov.

V druhom roku riešenia projektu sa realizovali 2 typy experimentov v rámci aktivity 4 „Príprava a testovanie nanonosičov kortikosterooidov a rekombinantného „spike“ proteínu ako biomodelu pre sledovanie komplikácií spojených s COVID-19“. Prvý experiment nadväzoval na predchádzajúce dosiahnuté výsledky týkajúce hľadania a uzavretie vhodného kortikosterooidu do biokompatibilných systémov. Ako modelové liečivá boli navrhnuté kortikosterooidy Prednisol (Pre) aj Prednisolone (PreL), ktoré boli nanoprecipitačnou metódou enkapsulované do biodegradovateľného polyméru kyseliny mliečnej (PLA). Kým vzorky s uzavretým (Pre) boli veľmi nestabilné, naopak vzorky s (PreL) vykazovali veľmi dobrú časovú stabilitu. Vzorky s rôznou vstupnou koncentráciou PreL v PLA nanospférach boli charakterizované rôznymi fyzikálnochemickými metódami s cieľom nájsť optimálny pomer liečiva a polyméru PLA a tak pripraviť stabilný polymérny nanonosič s enkapsulovaným modelovým liečivom pre sledovanie komplikácií spojených s COVID-19. Druhý experiment bol zameraný na vyselektovanie nového lieku na liečbu pacientov so syndrómom akútnej respiračnej tiesne (ARDS). Éra Covid-19 nám ukázala, aké náročné je liečiť pacientov so syndrómom ARDS. N-acetylcysteín bol navrhnutý ako mykotikum bežne používané pri liečbe dýchacích ciest. Liečivo rozpúšťa všetky zložky, ktoré spôsobujú viskózne hlien, a tým podporuje vykašliavanie. Po procese optimalizácie konjugácie liečiva na modifikované magnetické nanonosiče rôznymi fyzikálno-chemickými metódami, boli vzorky monitorované z hľadiska časovej stability v rôznych biologických médiach s cieľom nájsť optimálne podmienky pre ďalšie in vitro testovanie.

Súhrn najhodnotnejších výsledkov týkajúci sa syntézy magnetických nanonosičov obalených polymérom poly-L-lyzín a rôznymi aminokyselinami (prolín, a tryptofán) bol publikovaný v práci [1]. Tieto modifikované magnetické nanonosiče boli značené rádionuklidmi a následne testované in vitro (stabilita v médiách a rádiochemická čistota) ale aj in vivo (biodistribúcia).

Za účelom detekcie a terapie vírusových ochorení boli naďalej vyvíjané nové biokompatibilné kompozitné systémy magnetických nanočastíc s kremíkovou vrstvou silikou, ktorých povrch bol modifikovaný rôznymi chemickými zlúčeninami: chitozanom, poly-L-lyzínom a polyetyléniminom s cieľom preskúmať vplyv rôznych chemických skupín a kladného náboja na interakcie s biomakromolekulami a ich účinnosti na detekciu vírusov. Na základe fyzikálno-chemickej charakterizácie pripravených nanočastíc sme vyselektovali vzorky s kladným nábojom na povrchu pre in vitro testy. Pomocou fluorescencie a metódy magnetickej separácie bola testovaná účinnosť viazania modifikovaných kompozitných nanočastíc s RNA. Zároveň bola skúmaná aj ich väzba na bunkové membrány epitelových buniek HEK 293 prostredníctvom LDH metódy, ktorá je založená na sledovaní efektu rôznych látok na kompaktnosť bunkovej membrány. Povrchové vlastnosti kompozitných nanočastíc (náboj a veľkosť) do výraznej miery ovplyvňovali ich väzobné a separačné vlastnosti. Naše predbežné experimenty ukázali, že pripravené kompozitné materiály modifikované rôznymi chemickými zlúčeninami môžu byť použité na efektívnu separáciu RNA. Ich efektivita však závisí od náboja a veľkosti kompozitných materiálov, pričom častice s menším rozmerom a kladným nábojom sú najúčinnnejšie pre in vitro separáciu nukleových kyselín. Tieto výsledky boli zaslané na publikovanie.

Súhrn najhodnotnejších výsledkov týkajúci sa syntézy magnetických nanočastíc obalených polymérom poly-L-lyzín a aminokyselinami (prolín, a tryptofán) bol publikovaný v práci [1]. Tieto modifikované magnetické nanočastice boli značené rádionuklidmi a následne testované in vitro
